## Introductions — Phil

Java: Selection,  
Iteration,  
Inheritance,  
Composition

Phil Molyneux

- ▶ *Name* Phil Molyneux
- ▶ *Background*
  - ▶ Undergraduate: Physics and Maths (Sussex)
  - ▶ Postgraduate: Physics (Sussex), Operational Research (Brunel), Computer Science (University College, London)
  - ▶ Worked in Operational Research, Business IT, Web technologies, Functional Programming
- ▶ *First programming languages* Fortran, BASIC, Pascal
- ▶ *Favourite Software*
  - ▶ Haskell — pure functional programming language
  - ▶ Text editors TextMate, Sublime Text — previously Emacs
  - ▶ Word processing in  $\text{\LaTeX}$  — all these slides and notes
  - ▶ Mac OS X
- ▶ *Learning style* — I read the manual before using the software

## Interface — Host View

The screenshot shows the Adobe Connect Host View interface. On the left, a presentation slide is displayed with the following content:

**M250 Units 10, 11**  
Collections, Arrays, Sets, Maps, Lists

**Phil Molyneux**

**18 April 2021**

On the right, a sidebar menu is open, listing various topics under "M250 Units 10, 11" and "Phil Molyneux". The topics include:

- M250 Units 10, 11
- Phil Molyneux
- M250 Units 10, 11
- Tutorial Agenda
- Adobe Connect
- Classes and Interfaces
- Sets
- Maps
- Lists
- Collection Implementations
- TMA03 Practice Quiz
- Common Mistakes
- JShell
- What Next ?
- References

The Adobe Connect interface includes a toolbar at the top and a footer with navigation icons at the bottom. The footer also shows "1/119" and "Topic Bar".

## Interface — Participant View

The screenshot shows the Adobe Connect interface. The main window title is "M250-201 (M250-201) Online Meeting". The sidebar on the left is titled "M250 Units 10, 11 Tutorial Agenda" and lists the following topics: "Phil Molyneux", "Adobe Connect", "Classes and Interfaces", "Sets", "Maps", "Lists", "Collection Implementations", "TMA03 Practice Quiz", "Common Mistakes", "JShell", "What Next?", and "References". The main content area displays the slide "M250 Units 10, 11 Tutorial Agenda" with the title "M250 Units 10, 11 Tutorial Agenda" and the subtitle "Phil Molyneux". The slide content includes a section titled "Introductions" with the following bullet points:

- ▶ **Introductions**
  - ▶ Name *Phil Molyneux*
  - ▶ Learning Style: *Reads the manual*
  - ▶ Learnt last month *Framework for Teaching Recursion* and wrote notes on *Recursion Teaching*
  - ▶ You ?

The bottom of the slide shows "3/119". To the right of the main content, there are two smaller windows: "Attendee List" and "Participants". The "Attendee List" window shows "100" attendees, including "Phil2" and "Attendee 10". The "Participants" window shows "0" participants. At the bottom right of the main content area is a "Chat" window with the message "Start a conversation with everyone! Chat privately with the host, presenters or any attendee".

## Entering a Room as a Guest (1)

- ▶ Click on the link sent in email from the Host
- ▶ Get the following on a Web page
- ▶ As *Guest* enter your name and click on **Enter Room**

The screenshot shows the Adobe Connect guest entry interface. At the top, there is a logo and the text "Adobe Connect". Below that, the room details are displayed: "M269-21J Online tutorial room", "London/SE (1,13) CG [2311] (M269-21J)", and "(1)". There are two buttons at the top: "Guest" and "Registered User", with "Guest" being selected. Below these buttons is a "Name" input field, which contains "Guest Name". At the bottom of the page is a large blue "Enter Room" button.

# Statements

## Overview

- ▶ A statement may change the computer's state: value of variables, fields, array elements, the contents of files and so on — the execution of a statement may:
- ▶ terminate normally (and execution continues with the next statement, if any) or
- ▶ terminate abruptly by throwing an exception or
- ▶ exit by executing a `return` statement (if inside a method or constructor) or
- ▶ exit a switch or loop by executing a `break` statement or
- ▶ exit the current iteration of a loop and start a new iteration by executing a `continue` statement or
- ▶ does not terminate at all (eg, `while (true) {}`)

# Statements

## Expression & Block Statements

- ▶ An expression statement is an expression followed by a ;

*expression* ;

- ▶ The only forms of expression that may be used here are assignments, increment and decrements, method call, and object creation
- ▶ A block statement is a sequence of variable declarations, class declarations and statements

{  
  *variableDeclarations*  
  *classDeclarations*  
  *statements*  
}

- ▶ An empty statement consists of ; only — it is equivalent to the block statement { }

# Selection Statements

## if Statement

- ▶ The **if** statement has the form

```
if (condition)
  trueBranch
```

- ▶ The **if-else** statement has the form

```
if (condition)
  trueBranch
else
  falseBranch
```

- ▶ The condition must have type **boolean** or **Boolean**
- ▶ **trueBranch** and **falseBranch** are statements

# Selection Statements

## Common if errors (a)

- ▶ What is wrong with the following

```
if (dataAvailable) ;  
processData() ;
```

```
if (dataAvailable)  
processData() ;  
reportResults() ;
```

```
if (dataAvailable)  
processData() ;  
reportResults() ;  
else  
reportNoData() ;
```

# Selection Statements

## Common if errors (b)

```
if (dataAvailable) ;  
processData() ;
```

- ▶ The trueBranch is an empty statement (;

```
if (dataAvailable)  
processData() ;  
reportResults() ;
```

- ▶ reportResults() ; will always be executed

```
if (dataAvailable)  
processData() ;  
reportResults() ;  
else  
reportNoData() ;
```

- ▶ Will not compile
- ▶ **Moral** Always use block statements

# Selection Statements

## switch Statement

- ▶ A `switch` statement has the form

```
switch (expression) {  
    case constant1: branch1  
    case constant2: branch2  
    ...  
    default: branchN  
}
```

- ▶ expression must be of type `int`, `short`, `char`, `byte` or a boxed version of these or `String` or an enum type
- ▶ Each constant must be a compile-time constant expression, consisting only of literals, `final` variables, `final` fields declared with explicit field initialisers or an unqualified enum value
- ▶ (not used in M250)

# Iteration Statements

## for Statement

- ▶ A **for** statement has the form

```
for (initialization ; condition ; step)  
    body
```

- ▶ **initialization** is a variableDeclaration or an expression
- ▶ **condition** is an expression of type **boolean** or **Boolean**
- ▶ **step** is an expression
- ▶ **body** is a statement
- ▶ **initialization** and **step** may be comma-separated lists of expressions
- ▶ **initialization**, **condition** and **step** may be empty. An empty condition is equivalent to **true**

# for Statement

## Execution

- ▶ The `for` statement is executed as follows
  1. The initialization is executed
  2. The condition is evaluated. If it is `false`, the loop terminates.
  3. If it is `true` then
    - (a) the body is executed
    - (b) the step is executed
    - (c) execution continues at (2.)

**  
***  
****
```

# Iteration Statements

## while Statement

- ▶ A `while` statement has the form

```
while (condition)
  body
```

- ▶ `condition` is an expression of type `boolean` or `Boolean` and `body` is a statement
- ▶ It is executed as follows:
  1. The `condition` is evaluated. If it is `false`, the loop terminates
  2. If it is `true`, then
    - (a) The `body` is executed
    - (b) Execution continues at (1.)

# while Statement

## while Example 1(a)

### ► Example linear search with `while` loop

```
String[] wdays =  
{"Monday", "Tuesday", "Wednesday",  
 "Thursday", "Friday", "Saturday", "Sunday"} ;  
  
int wdayno(String wday) {  
    int i = 0 ;  
    while (i < wdays.length  
          && ! wday.equals(wdays[i])) {  
        i++ ;  
    }  
    if (i < wdays.length) {  
        return i ;  
    } else {  
        return -1 ;  
    }  
}
```

# while Statement

## while Example 1(b)

```
String[] wdays =  
{"Monday", "Tuesday", "Wednesday",  
 "Thursday", "Friday", "Saturday", "Sunday"} ;  
  
int wdayno(String wday) {  
    int i = 0 ;  
    while (i < wdays.length  
          && ! wday.equals(wdays[i])) {  
        i++ ;  
    }  
    if (i < wdays.length) {  
        return i ;  
    } else {  
        return -1 ;  
    }  
} ;
```

```
jshell> int d1 = wdayno("Friday") ;  
d1 ==> 4  
  
jshell> int d2 = wdayno("Dimanche") ;  
d2 ==> -1
```

# while Statement

## while Example 2(b)

- ▶ Write code using a **while** statement that is equivalent to a **for** loop statement

```
initialization
while (condition) {
    body
    step
}
```

```
for (initialization ; condition ; step)
    body
```

- ▶ Note that this is different behaviour to the **for** statement in Python where assignments to variables in the suite of the loop does not change the assignments made in the target list
- ▶ See [Python: for statement](#)

# Iteration Statements

## foreach Statement

- ▶ A variant of the `for` statement to iterate over elements of a collection (or *iterable*)

```
for (ElementType x : expression)
    body
```

- ▶ expression must have type `Iterable<t>` where `t` is some subtype of `ElementType` or an array
- ▶ All collections are directly iterable since `Collection<t>` has superinterface `Iterable<t>`
- ▶ Entries of a map can be iterated over because interface `Map<K, V>` describes a method `entrySet` that returns a `Set<Map.Entry<K, V>>` which implements `Iterable(Map.Entry<K, V>>)`

# Iteration Statements

## Removing While Iterating

- ▶ Removing elements from a collection while iterating over it is fraught with problems
- ▶ Likely to generate errors ([ConcurrentModificationException](#))
- ▶ Proper way is to use an [Iterator](#)
- ▶ Example from Barnes (2016, page 134) *Objects First with Java*

```
Iterator<Track> it = tracks.iterator() ;  
while (it.hasNext()) {  
    Track t = it.next() ;  
    String artist = t.getArtist() ;  
    if (artist.equals(artistToRemove)) {  
        it.remove() ;  
    }  
}
```

# Returns, Exits and Exceptions

## return Statement

- ▶ A **return** statement with an expression argument has the form:

```
return expression ;
```

- ▶ This form of **return** must occur in the body of a method (not constructor) whose return type is a supertype or boxed or unboxed version of the type of expression
- ▶ The **return** statement is executed as follows:
  - ▶ expression is evaluated to some value **v**
  - ▶ It then exits the method and continues execution at the method call expression that called the method
  - ▶ The value of that expression will be **v**, possible after application of a widening, boxing or unboxing conversion

# return Statement

## return Example 1

- ▶ `wdayno` using a `for` loop

```
int wdayno(String wday) {  
    for (int i = 0 ; i < wdays.length ; i++) {  
        if (wday.equals(wdays[i])) {  
            return i ;  
        }  
    }  
    return -1 ;  
}
```

- ▶ Notice that the final `return` is after the `for` loop
- ▶ What is the effect of the code below?

```
int wdayno(String wday) {  
    for (int i = 0 ; i < wdays.length ; i++) {  
        if (wday.equals(wdays[i])) {  
            return i ;  
        }  
    }  
    return -1 ;  
}
```

# return Statement

## return Example 1(b)

```
jshell> int wdayno(String wday) {  
...>     for (int i = 0 ; i < wdays.length ; i++) {  
...>         if (wday.equals(wdays[i])) {  
...>             return i ;  
...>         }  
...>     return -1 ;  
...> }  
...>  
| Error:  
| missing return statement  
| int wdayno(String wday) {  
| ^
```

# Returns, Exits and Exceptions

break, continue, label

- ▶ A **break** statement is legal only inside a loop or switch and has one of the forms

```
break ;  
break LabelName ;
```

- ▶ Executing **break** exits the innermost enclosing loop or switch and continues execution after that loop or switch
- ▶ A **continue** statement is legal only inside a loop and has one of the forms

```
continue ;  
continue LabelName ;
```

- ▶ Executing **continue** terminates the current iteration of the innermost enclosing loop and continues execution at the step in **for** loops or the condition in **while** and **do-while** loops

# Returns, Exits and Exceptions

break, continue, label

- ▶ A **label** statement has the form

```
labelName : statement
```

- ▶ The scope of `labelName` is `statement`, where it can be used in **break** or **continue**
- ▶ Use of labels is evidence of poor program design
- ▶ Just don't

# Returns, Exits and Exceptions

## throw Statement

- ▶ A `throw` statement has the form:

```
throw expression ;
```

- ▶ The type of expression must be a subtype of class `Throwable`
- ▶ The `throw` statement is executed as follows:
  - ▶ expression is evaluated to obtain an exception object `v`
  - ▶ If it is `null` then a `NullPointerException` is thrown
  - ▶ Otherwise the exception object `v` is thrown
  - ▶ The enclosing block statement terminates abruptly
  - ▶ The thrown exception may be caught by a dynamically enclosing `try-catch` statement
  - ▶ If the exception is not caught then the entire program execution will be aborted

# Returns, Exits and Exceptions

## try-catch-finally Statement

- ▶ A **try-catch** statement is used to catch particular exceptions thrown by a code block
- ▶ It has the following form:

```
try
  body
catch (E1 x1) catchBody1
catch (E21 | E22 | ... | E2k x2) catchBody2
...
finally finallyBody
```

- ▶ All the various bodies are block statements
- ▶ There can be zero or more **catch** clauses and the **finally** clause may be absent, but there must be at least one **catch** or **finally** clause

# assert Statement

## Description

- ▶ The **assert** statement has one of the following forms:

```
assert booleanExpression ;  
assert booleanExpression : expression ;
```

- ▶ `booleanExpression` must have type `boolean` or `Boolean`
- ▶ `expression` must be of type `boolean`, `char`, `double`, `float`, `int`, `long`, a boxed version of these or `Object`
- ▶ When assertions are enabled at run-time, every execution of the **assert** command will evaluate `booleanExpression`
- ▶ If the result is `true`, program execution continues normally
- ▶ If the result is `false`, the assertion fails, and an `AssertionError` will be thrown
- ▶ In the second form, `expression` will be evaluated, and its value passed to the appropriate `AssertionError` constructor

# assert Statement

## assert Example 1(a)

- ▶ See Unit 8 section 7

```
assert x > 2 : "x_was_" + x ;
```

► **Lollipop attachStick()**

```
/**  
 * Attach a stick to an existing sweet.  
 * The sweet must have been initialised already.  
 */  
  
private void attachStick() {  
    int radius = this.sweet.getDiameter() / 2 ;  
  
    //move stick to the right to reach sweet centre  
    this.stick.setXPos(this.sweet.getXPos()  
        + radius  
        - this.stick.getWidth() / 2) ;  
  
    //move stick down near the bottom of the sweet  
    this.stick.setYPos(this.sweet.getYPos()  
        + this.sweet.getDiameter()  
        - STICK_WIDTH) ;  
}
```

# Composition

## Lollipop Class (5) Horizontal, Vertical Movement

▶ **Lollipop Horizontal, Vertical Movement**

```
/**  
 * Method to move a lollipop horizontally.  
 * The direction depends on the sign of the argument.  
 */  
public void horiz(int xinc) {  
    this.sweet.setXPos(this.sweet.getXPos() + xinc) ;  
    this.stick.setXPos(this.stick.getXPos() + xinc) ;  
}  
  
/**  
 * Method to move a lollipop vertically.  
 * The direction depends on the sign of the argument.  
 */  
public void vert(int yinc) {  
    this.sweet.setYPos(this.sweet.getYPos() + yinc) ;  
    this.stick.setYPos(this.stick.getYPos() + yinc) ;  
}
```

# Composition

## Lollipop Class (6) Eat Sweet

### ► Lollipop Eat Sweet

```
/**  
 * When you lick a lollipop, its sweet shrinks and  
 * its stick changes colour  
 * to get closer to the sweet's colour.  
 */  
public void lick() {  
    if (this.sweet.getDiameter() > 1) {  
        this.licks = this.licks + 1 ;  
  
        this.sweet.setDiameter(this.sweet.getDiameter()  
                               - 2) ;  
  
        //Move the sweet so it stays on the stick  
        //If we used attachStick,  
        //the lollipop would move when licked.  
        //This is because the circle is drawn relative  
        //to the top-left corner of its bounding box.  
  
        this.sweet.setXPos(this.sweet.getXPos() + 1) ;  
        this.sweet.setYPos(this.sweet.getYPos() + 2) ;
```

## Lollipop Interaction (2)

- ▶ **Lollipop Example 1 (a) (contd)**
- ▶ After the above code is executed

The screenshot shows a Java IDE interface with the following components:

- Shapes** (Title bar): A window titled "Shapes" containing a red lollipop icon with a pink stick.
- Code Pane**: A code editor window titled "OUWorkspace [Project: Unit4\_Project\_6]" containing the following Java code:

```
Lollipop lo = new Lollipop(c, r);
lo.vert(10);
lo.horiz(20);
lo.lick();
lo.lick();
lo.lick();
lo.getLicks();
```
- Display Pane**: A window titled "Display Pane" showing the value "3".
- Variables**: A list of variables: "c", "lo", and "r". The variable "lo" is highlighted with a blue selection bar.
- Show Results**: A checkbox labeled "Show Results" with a checked state.

lo.lick();  
lo.getLicks();
```

- ▶ We can see the instance of the **Lollipop** has moved down, right
- ▶ The **sweet** has shrunk and the **stick** has changed colour (slightly)
- ▶ Notice that the **sweet** is now displayed overlapping the **stick** — what code should we have had to avoid this ?

# Composition

## Summary

- ▶ Composition is a relationship between classes in which component objects form part of composite objects.
- ▶ Composite object classes have instance variables that are of their component object class types.
- ▶ When initialising a composite object, its component parts also need to be suitably initialised.
- ▶ Anonymous objects can be used to avoid storing unnecessary references to objects that might break encapsulation.
- ▶ Favour composition over inheritance — see Bloch (2017, Item 18, page 87)
- ▶ Composition **has-a** relationship
- ▶ Inheritance **is-a** relationship

## Programming, Debugging, Psychology

Although programming techniques have improved immensely since the early days, the process of finding and correcting errors in programming — known graphically if inelegantly as *debugging* — still remains a most difficult, confused and unsatisfactory operation. The chief impact of this state of affairs is psychological. Although we are happy to pay lip-service to the adage that to err is human, most of us like to make a small private reservation about our own performance on special occasions when we really try. It is somewhat deflating to be shown publicly and incontrovertibly by a machine that even when we do try, we in fact make just as many mistakes as other people. If your pride cannot recover from this blow, you will never make a programmer.

*Christopher Strachey, Scientific American 1966 vol 215 (3) September  
pp112-124*

# What Next ?

To err is human ?

- ▶ To err is human, to really foul things up requires a computer.
- ▶ Attributed to [Paul R. Ehrlich](#) in [101 Great Programming Quotes](#)
- ▶ Attributed to [Bill Vaughn](#) in [Quote Investigator](#)
- ▶ Derived from [Alexander Pope \(1711, An Essay on Criticism\)](#)
- ▶ *To Err is Humane; to Forgive, Divine*
- ▶ This also contains
  - A little learning is a dangerous thing;  
Drink deep, or taste not the [Pierian Spring](#)*
- ▶ In programming, this means you have to *read the fabulous manual (RTFM)*

Module: `java.base`  
Package: `java.lang`  
**Class String**  
  
java.lang.Object  
java.lang.String  
  
All Implemented Interfaces:  
`Serializable, CharSequence, Comparable<String>, Constable, ConstantDesc`  
  
public final class String  
extends Object  
implements Serializable, Comparable<String>, CharSequence, Constable, ConstantDesc  
  
The String class represents character strings. All string literals in Java programs, such as "abc", are implemented as instances of this class.  
  
Strings are constant; their values cannot be changed after they are created. String buffers support mutable strings. Because String objects are immutable they can be shared. For example:  
  
`String str = "abc";`

- ▶ **Strings are *immutable* objects**
- ▶ See `java.lang.StringBuilder` for *mutable* strings
- ▶ In a *functional programming approach* everything is immutable — it makes life simpler (but at a cost)

The screenshot shows the Java API documentation for the `String.equals` method. The URL is [docs.oracle.com/en/java/javase/13/docs/api/java.base/java/lang/String.html#equals\(java.lang.Object\)](https://docs.oracle.com/en/java/javase/13/docs/api/java.base/java/lang/String.html#equals(java.lang.Object)). The page title is "equals" and the navigation bar includes "OVERVIEW", "MODULE", "PACKAGE", "CLASS", "USE", "TREE", "DEPRECATED", "INDEX", and "HELP". The search bar contains "Search". The main content area shows the `public boolean equals(Object anObject)` method. The description states: "Compares this string to the specified object. The result is true if and only if the argument is not null and is a String object that represents the same sequence of characters as this object." It notes that for finer-grained String comparison, refer to `Collator`. The "Overrides" section indicates that `equals` is in class `Object`. The "Parameters" section shows `anObject` as "The object to compare this String against". The "Returns" section states "true if the given object represents a String equivalent to this string, false otherwise". The "See Also" section lists `compareTo(String)` and `equalsIgnoreCase(String)`. The bottom of the page shows a file list: "LBOA-2019102....zip", "Christina2007N....jpg", "Christina2012N....jpg", and "system-f-with-t....b...". A "Show All" button is also present.

- ▶ Remember `(==)` tests for *identity* — what does this mean ?

# M250

## Books Phil Likes

- ▶ M250 is self contained — you do not need further books — but you might like to know about some:
- ▶ Sestoft (2016) Java Precisely — the best short reference
- ▶ Evans, Flanagan (2018) Java in a Nutshell — the best longer reference
- ▶ Barnes, Kölking (2016) Objects First with Java — the BlueJ book — see [www.bluej.org](http://www.bluej.org) for documentation and tutorial
- ▶ Bloch (2017) Effective Java — guide to best practice
