M269 Exam Revision

Agenda & Aims

- 1. Welcome and introductions
- 2. Revision strategies
- 3. M269 Exam Part 1 has 15 questions 60%
- 4. M269 Exam Part 2 has 2 questions 40%
- 5. M269 Exam 3 hours, Part 1 100 mins, Part 2 70 mins
- 6. M269 2013J exam Part 1 in reverse order
- 7. M269 2013J exam Part 2 in notes version
- Note: In 2015J the exam does not assess Sections 3 and 4 of Unit 7, Chapter 6 of the Reader — Computational Complexity and P vs NP
- 9. Topics and discussion for each question
- 10. Exam techniques

- ▶ Which *two* of the following statements are true?
- A. A Turing Machine is a mathematical model of computational problems.
- B. If the lower bound for a computational problem is $O(n^2)$, then there is an algorithm that solves the problem and which has complexity $O(n^2)$.
- C. Searching a sorted list is not in the class NP.
- D. The decision Travelling Salesperson Problem is NP-complete.
- E. There is no known tractable quantum algorithm for solving a known NP-complete problem.

M269 Exam 2013J

Q 15 Solution

- Only D and E are true.
- A Universal Turing Machine can compute any computable sequence but there are well defined problems that are not computable. (So not A)
- ➤ A lower bound may be lower than any actual algorithm. (So not B)
- Every problem in P is in NP we just do not know if P == NP (So not C)

Reducing one problem to another

- ▶ To reduce problem P_1 to P_2 , invent a construction that converts instances of P_1 to P_2 that have the same answer. That is:
 - any string in the language P₁ is converted to some string in the language P₂
 - \blacktriangleright any string over the alphabet of P_1 that is not in the language of P_1 is converted to a string that is not in the language P_2
- ▶ With this construction we can solve P₁
 - Given an instance of P_1 , that is, given a string w that may be in the language P_1 , apply the construction algorithm to produce a string x
 - ► Test whether *x* is in *P*₂ and give the same answer for *w* in *P*₁

M269 Exam

Exam Techniques

Epilogue: Logic, Programming and Computation

Direction of Reduction

- ▶ The direction of reduction is important
- ▶ If we can reduce P_1 to P_2 then (in some sense) P_2 is at least as hard as P_1 (since a solution to P_2 will give us a solution to P_1)
- ▶ So, if P_2 is decidable then P_1 is decidable
- ➤ To show a problem is undecidable we have to reduce from an known undecidable problem to it
- $\forall x (\mathsf{dp}_{P_1}(x) = \mathsf{dp}_{P_2}(\mathsf{reduce}(x)))$
- \blacktriangleright Since, if P_1 is undecidable then P_2 is undecidable

Models of Computation

- In automata theory, a problem is the question of deciding whether a given string is a member of some particular language
- ▶ If Σ is an alphabet, and L is a language over Σ , that is $L \subseteq \Sigma^*$, where Σ^* is the set of all strings over the alphabet Σ then we have a more formal definition of decision problem
- ▶ Given a string $w \in \Sigma^*$, decide whether $w \in L$
- Example: Testing for a prime number can be expressed as the language L_p consisting of all binary strings whose value as a binary number is a prime number (only divisible by 1 or itself)

Church-Turing Thesis & Quantum Computing

- Church-Turing thesis Every function that would naturally be regarded as computable can be computed by a deterministic Turing Machine.
- physical Church-Turing thesis Any finite physical system can be simulated (to any degree of approximation) by a Universal Turing Machine.
- strong Church-Turing thesis Any finite physical system can be simulated (to any degree of approximation) with polynomial slowdown by a Universal Turing Machine.
- ► Shor's algorithm (1994) quantum algorithm for factoring integers an NP problem that is not known to be P also not known to be NP-complete and we have no proof that it is not in P

Turing Machine

- Finite control which can be in any of a finite number of states
- Tape divided into cells, each of which can hold one of a finite number of symbols
- Initially, the input, which is a finite-length string of symbols in the input alphabet, is placed on the tape
- All other tape cells (extending infinitely left and right) hold a special symbol called blank
- ► A **tape head** which initially is over the leftmost input symbol
- ► A **move** of the Turing Machine depends on the state and the tape symbol scanned
- ► A move can change state, write a symbol in the current cell, move left, right or stay

M269 Exam 2013J Q 15

- Q finite set of states of the finite control
- \triangleright Σ finite set of input symbols (M269 S)
- ▶ Γ complete set of *tape symbols* Σ ⊂ Γ
- \triangleright δ Transition function (M269 instructions, I) $\delta :: Q \times \Gamma \to Q \times \Gamma \times \{L, R, S\}$ $\delta(q,X)\mapsto(p,Y,D)$
- $\delta(q,X)$ takes a state, q and a tape symbol, X and returns (p, Y, D) where p is a state, Y is a tape symbol to overwrite the current cell, D is a direction, Left, Right or Stay
- $ightharpoonup q_0$ start state $q_0 \in Q$
- ▶ B blank symbol $B \in \Gamma$ and $B \notin \Sigma$
- ▶ F set of final or accepting states $F \subseteq Q$

M269 Exam 2013J Q 15

Decidability

- ▶ **Decidable** there is a TM that will halt with yes/no for a decision problem that is, given a string w over the alphabet of P the TM with halt and return yes.no the string is in the language P (same as recursive in Recursion theory old use of the word)
- ▶ Semi-decidable there is a TM will halt with yes if some string is in P but may loop forever on some inputs (same as recursively enumerable) — Halting Problem
- ► **Highly-undecidable** no outcome for any input *Totality, Equivalence Problems*

Undecidable Problems

- ► Halting problem the problem of deciding, given a program and an input, whether the program will eventually halt with that input, or will run forever term first used by Martin Davis 1952
- ▶ Entscheidungsproblem the problem of deciding whether a given statement is provable from the axioms using the rules of logic shown to be undecidable by Turing (1936) by reduction from the *Halting problem* to it
- ➤ Type inference and type checking in the second-order lambda calculus (important for functional programmers, Haskell, GHC implementation)
- ▶ Undecidable problem see link to list

Why undecidable problems must exist

- A problem is really membership of a string in some language
- ► The number of different languages over any alphabet of more than one symbol is uncountable
- Programs are finite strings over a finite alphabet (ASCII or Unicode) and hence countable.
- ► There must be an infinity (big) of problems more than programs.

Epilogue: Logic,
Programming and
Computation

- ► In the 1930s the idea was made more formal: which functions are computable?
- ▶ A function a set of pairs $f = \{(x, f(x)) : x \in X \land f(x) \in Y\}$ with the function property
- ▶ Function property: $(a,b) \in f \land (a,c) \in f \Rightarrow b == c$
- Function property: Same input implies same output
- Note that maths notation is deeply inconsistent here see Function and History of the function concept
- ▶ What do we mean by computing a function an algorithm ?

Computability and Terminology (2)

- ▶ In the 1930s three definitions:
- λ-Calculus, simple semantics for computation Alonzo Church
- ► General recursive functions Kurt Gödel
- ▶ Universal (Turing) machine Alan Turing
- ▶ Terminology:
 - ► Recursive, recursively enumerable Church, Kleene
 - Computable, computably enumerable Gödel, Turing
 - Decidable, semi-decidable, highly undecidable
 - ▶ In the 1930s, computers were human
 - Unfortunate choice of terminology
- Turing and Church showed that the above three were equivalent
- ► Church-Turing thesis function is intuitively computable if and only if Turing machine computable

P and NP

- P, the set of all decision problems that can be solved in polynomial time on a deterministic Turing machine
- NP, the set of all decision problems whose solutions can be verified (certificate) in polynomial time
- Equivalently, NP, the set of all decision problems that can be solved in polynomial time on a non-deterministic Turing machine
- ▶ A decision problem, dp is NP-complete if
 - 1. dp is in NP and
 - Every problem in NP is reducible to dp in polynomial time
- NP-hard a problem satisfying the second condition, whether or not it satisfies the first condition. Class of problems which are at least as hard as the hardest problems in NP. NP-hard problems do not have to be in NP and may not be decision problems

Points on Notes

- ► The *Boolean satisfiability problem (SAT)* was the first decision problem shown to be *NP-Complete*
- ▶ This section gives a sketch of an explanation
- ► **Health Warning** different texts have different notations and there will be some inconsistency in these notes
- ▶ **Health warning** these notes use some formal notation to make the ideas more precise computation requires precise notation and is about manipulating strings according to precise rules.

The NP-Complete Class

- ▶ If we do not know if $P \neq NP$, what can we say ?
- ▶ A language *L* is *NP-Complete* if:
 - ▶ $L \in NP$ and
 - ▶ for all other $L' \in NP$ there is a polynomial time transformation (Karp reducible, reduction) from L' to L
- ▶ Problem P_1 polynomially reduces (Karp reduces, transforms) to P_2 , written $P_1 \propto P_2$ or $P_1 \leq_p P_2$, iff $\exists f : \mathsf{dp}_{P_1} \to \mathsf{dp}_{P_2}$ such that
 - $\forall I \in \mathsf{dp}_{P_1}[I \in Y_{P_1} \Leftrightarrow f(I) \in Y_{P_2}]$
 - ▶ f can be computed in polynomial time

M269 Exam Section 2

Exam Techniques

Epilogue: Logic, Programming and Computation

- More formally, $L_1\subseteq \Sigma_1^*$ polynomially transforms to $L_2\subseteq \Sigma_2^*$, written $L_1\propto L_2$ or $L_1\leq_p L_2$, iff $\exists f:\Sigma_1^*\to\Sigma_2^*$ such that
 - $\forall x \in \Sigma_1^* [x \in L_1 \Leftrightarrow f(x) \in L_2]$
 - ightharpoonup There is a polynomial time TM that computes f
- ▶ Transitivity If $L_1 \propto L_2$ and $L_2 \propto L_3$ then $L_1 \propto L_3$
- ▶ If L is NP-Hard and $L \in P$ then P = NP
- ▶ If L is NP-Complete, then $L \in P$ if and only if P = NP
- ▶ If L_0 is NP-Complete and $L \in \mathbb{NP}$ and $L_0 \propto L$ then L is NP-Complete
- ► Hence if we find one NP-Complete problem, it may become easier to find more
- ► In 1971/1973 Cook-Levin showed that the Boolean satisfiability problem (SAT) is NP-Complete

The Boolean Satisfiability Problem

- A propositional logic formula or Boolean expression is built from variables, operators: AND (conjunction, ∧), OR (disjunction, ∨), NOT (negation, ¬)
- ▶ A formula is said to be *satisfiable* if it can be made True by some assignment to its variables.
- ► The Boolean Satisfiability Problem is, given a formula, check if it is satisfiable.
 - Instance: a finite set U of Boolean variables and a finite set C of clauses over U
 - Question: Is there a satisfying truth assignment for C?
- ► A *clause* is is a disjunction of variables or negations of variables
- Conjunctive normal form (CNF) is a conjunction of clauses
- ► Any Boolean expression can be transformed to CNF

section 2

Exam Techniques

Epilogue: Logic, Programming and Computation

- ▶ Given a set of Boolean variable $U = \{u_1, u_2, \dots, u_n\}$
- ▶ A literal from U is either any u_i or the negation of some u_i (written $\overline{u_i}$)
- ▶ A clause is denoted as a subset of literals from U $\{u_2, \overline{u_4}, u_5\}$
- ► A clause is satisfied by an assignment to the variables if at least one of the literals evaluates to True (just like disjunction of the literals)
- ▶ Let C be a set of clauses over U C is satisfiable iff there is some assignment of truth values to the variables so that every clause is satisfied (just like CNF)
- $ightharpoonup C = \{\{u_1, u_2, u_3\}, \{\overline{u_2}, \overline{u_3}\}, \{u_2, \overline{u_3}\}\}$ is satisfiable
- $C = \{\{u_1, u_2\}, \{u_1, \overline{u_2}\}, \{\overline{u_1}\}\}$ is not satisfiable

The Boolean Satisfiability Problem (3)

- ▶ Proof that SAT is NP-Complete looks at the structure of NDTMs and shows you can transform any NDTM to SAT in polynomial time (in fact logarithmic space suffices)
- SAT is in NP since you can check a solution in polynomial time
- ▶ To show that $\forall L \in \mathsf{NP} : L \propto \mathsf{SAT}$ invent a polynomial time algorithm for each polynomial time NDTM, M, which takes as input a string x and produces a Boolean formula E_x which is satisfiable iff M accepts x
- ► See Cook-Levin theorem

Coping with NP-Completeness

- What does it mean if a problem is NP-Complete ?
 - ▶ There is a P time verification algorithm.
 - ▶ There is a P time algorithm to solve it iff P = NP (?)
 - No one has yet found a P time algorithm to solve any NP-Complete problem
 - ► So what do we do ?
- Improved exhaustive search Dynamic Programming;
 Branch and Bound
- Heuristic methods acceptable solutions in acceptable time — compromise on optimality
- Average time analysis look for an algorithm with good average time — compromise on generality (see Big-O Algorithm Complexity Cheatsheet)
- ► Probabilistic or Randomized algorithms compromise on correctness

Logic

Logicians, Logics, Notations

- ▶ A plethora of logics, proof systems, and different notations can be puzzling.
- ▶ Martin Davis, Logician When I was a student, even the topologists regarded mathematical logicians as living in outer space. Today the connections between logic and computers are a matter of engineering practice at every level of computer organization
- Various logics, proof systems, were developed well before programming languages and with different motivations.

M269

Phil Molvneux

Logic

Logic

Logic and Programming Languages

- Turing machines, Von Neumann architecture and procedural languages Fortran, C, Java, Perl, Python, JavaScript
- Resolution theorem proving and logic programming Prolog
- Logic and database query languages SQL (Structured Query Language) and QBE (Query-By-Example) are syntactic sugar for first order logic

Logical Arguments

Validity and Justification

- ► There are two ways to model what counts as a logically good argument:
 - ▶ the **semantic** view
 - the syntactic view
- ▶ The notion of a valid argument in propositional logic is rooted in the semantic view.
- ▶ It is based on the semantic idea of interpretations: assignments of truth values to the propositional variables in the sentences under discussion.
- ► A *valid argument* is defined as one that preserves truth from the premises to the conclusions
- The syntactic view focuses on the syntactic form of arguments.
- Arguments which are correct according to this view are called *justified arguments*.

Epilogue: Logic, Programming and Computation

Logical Arguments

Proof Systems, Soundness, Completeness

- Semantic validity and syntactic justification are different ways of modelling the same intuitive property: whether an argument is logically good.
- A proof system is sound if any statement we can prove (justify) is also valid (true)
- ► A proof system is *adequate* if any valid (true) statement has a proof (justification)
- A proof system that is sound and adequate is said to be complete
- Propositional and predicate logic are complete arguments that are valid are also justifiable and vice versa
- Unit 7 section 2.4 describes another logic where there are valid arguments that are not justifiable (provable)

nits 1 & 2

Section 2

Exam Techniques

Epilogue: Logic, Programming and Computation

Logical Arguments

Valid arguments

 P_1

▶ Unit 6 defines valid arguments with the notation

<u>n</u>

- ► The argument is valid if and only if the value of C is True in each interpretation for which the value of each premise P_i is True for 1 < i < n</p>
- ▶ In some texts you see the notation $\{P_1, \ldots, P_n\} \models C$
- ► The expression denotes a *semantic sequent* or *semantic* entailment
- ► The |= symbol is called the *double turnstile* and is often read as *entails* or *models*
- ▶ In LaTeX ⊨ and ⊨ are produced from \vDash and \models — see also the turnstile package
- ► In Unicode |= is called *TRUE* and is U+22A8, HTML ⊨

Logical Arguments

Valid arguments — Tautology

- ▶ The argument $\{\} \models C$ is valid if and only if C is True in all interpretations
- That is, if and only if C is a tautology
- ▶ Beware different notations that mean the same thing
 - ▶ Alternate symbol for empty set: $\emptyset \models C$
 - ▶ Null symbol for empty set: $\models C$
 - Original M269 notation with null axiom above the line: $\frac{C}{C}$

Logic

Justified Arguments

- ▶ Definition 7.1 An argument $\{P_1, P_2, \dots, P_n\} \vdash C$ is a justified argument if and only if either the argument is an instance of an axiom or it can be derived by means of an inference rule from one or more other justified arguments.
- Axioms

$$\Gamma \cup \{A\} \vdash A \text{ (axiom schema)}$$

- ► This can be read as: any formula **A** can be derived from the assumption (premise) of {**A**} itself
- The ⊢ symbol is called the turnstile and is often read as proves, denoting syntactic entailment
- In LaTeX ⊢ is produced from \vdash
- In Unicode ⊢ is called RIGHT TACK and is U+22A2, HTML ⊢

Logic

Justified Arguments

- Section 2.3 of Unit 7 (not the Unit 6, 7 Reader) gives the inference rules for →, ∧, and ∨ — only dealing with positive propositional logic so not making use of negation — see List of logic systems
- Usually (Classical logic) have a functionally complete set of logical connectives — that is, every binary Boolean function can be expressed in terms the functions in the set

Section 2

Exam Techniques

Epilogue: Logic, Programming and Computation

Inference Rules — Implication

The above should be read as: If there is a proof (justification, inference) for B under the set of premises, Γ, augmented with A, then we have a proof (justification. inference) of A → B, under the unaugmented set of premises, Γ.

The unaugmented set of premises, Γ may have contained \boldsymbol{A} already so we cannot assume

$$(\mathbf{\Gamma} \cup \{\mathbf{A}\}) - \{\mathbf{A}\}$$
 is equal to $\mathbf{\Gamma}$

$$\qquad \qquad \qquad \frac{\Gamma \vdash A \quad \Gamma \vdash A \to B}{\Gamma \vdash B} \ (\rightarrow \text{-elimination})$$

Inference Rules — Disjunction

- $\qquad \qquad \frac{\Gamma \vdash A}{\Gamma \vdash A \lor B} \ (\lor \text{-introduction left})$
- $\qquad \qquad \frac{\Gamma \vdash B}{\Gamma \vdash A \lor B} \text{ (\vee-introduction right)}$
- ► Disjunction elimination

$$\frac{\Gamma \vdash A \lor B \quad \Gamma \cup \{A\} \vdash C \quad \Gamma \cup \{B\} \vdash C}{\Gamma \vdash C} \text{ (\lor-elimination)}$$

The above should be read: if a set of premises Γ justifies the conclusion $A \vee B$ and Γ augmented with each of A or B separately justifies C, then Γ justifies C

Epilogue: Logic, Programming and Computation

Logic

- ► The syntax of proofs is recursive:
- ▶ A proof is either an axiom, or the result of applying a rule of inference to one, two or three proofs.
- ▶ We can therefore represent a proof by a tree diagram in which each node have one, two or three children
- ▶ For example, the proof of $\{P \land (P \rightarrow Q)\} \vdash Q$ in Question 4 (in the Logic tutorial notes) can be represented by the following diagram:

$$\frac{\{P \land (P \rightarrow Q)\} \vdash P \land (P \rightarrow Q)}{\{P \land (P \rightarrow Q)\} \vdash P} (\land - \mathsf{E} \ \mathsf{left}) \quad \frac{\{P \land (P \rightarrow Q)\} \vdash P \land (P \rightarrow Q)}{\{P \land (P \rightarrow Q)\} \vdash P \rightarrow Q}}{\{P \land (P \rightarrow Q)\} \vdash Q} (\land - \mathsf{E} \ \mathsf{right}) \quad \mathsf{ind} \quad \mathsf{Exam} \ \mathsf{Text} \quad \mathsf{Te$$

Self-Assessment activity 7.4

▶ Let
$$\Gamma = \{P \rightarrow R, Q \rightarrow R, P \lor Q\}$$

$$\qquad \qquad \frac{\Gamma \vdash P \lor Q \quad \Gamma \cup \{P\} \vdash R \quad \Gamma \cup \{Q\} \vdash R}{\Gamma \vdash R} \text{ (\lor-elimination)}$$

$$\qquad \qquad \frac{\Gamma \cup \{P\} \vdash P \quad \Gamma \cup \{P\} \vdash P \rightarrow R}{\Gamma \cup \{P\} \vdash R} \ (\rightarrow \text{-elimination})$$

$$\qquad \qquad \frac{\Gamma \cup \{Q\} \vdash Q \quad \Gamma \cup \{Q\} \vdash Q \rightarrow R}{\Gamma \cup \{Q\} \vdash R} \ (\rightarrow \text{-elimination})$$

Q 12

- ▶ A particular interpretation of predicate logic allows facts to be expressed about films that people have seen, and of which they own copies.
- ▶ Some of the assignments in the interpretation are given below (where the symbol \mathcal{I} is used to show assignment).
- ► The interpretation assigns Jane, John and Saira to the constants jane, john and saira.

```
\mathcal{I}(\mathsf{jane}) = \mathsf{Jane}

\mathcal{I}(\mathsf{john}) = \mathsf{John}

\mathcal{I}(\mathsf{saira}) = \mathsf{Saira}

Q 12(a) Solution

- (a) For all films, if Saira owns a copy of the film, then Saira has seen the film.
 - Or more idiomatically, Saira has seen all of the films that she owns.
 - ▶ The sentence is *FALSE*, because the enumerations of the relations show that she owns a copy of *Casablanca*, but this is not one of the films that she has seen. She also owns a copy of *El Topo*, which she has not seen either, but we only need one counter-example to show that the sentence is false.

Jnits 3, 4 & 5

Jnits 1 & 2

M269 Exam Section 2

Exam Techniques

Epilogue: Logic, Programming and Computation

Q 11 Solution

- (a) A WFF is *satisfiable* if it is possible to find an interpretation that makes the formula true.
- (b) Truth table for the WFF

Р	Q	R	$Q \rightarrow P$	P o (Q o P)	$\neg R$	$(P o (Q o P)) \lor \neg F$
F	F	F	Т	Т	Т	Т
F	F	Т	Т	T	F	Т
F	Т	F	F	Т	Т	Т
F	Т	Т	F	Т	F	Т
Т	F	F	Т	Т	Т	Т
Т	F	Т	Т	Т	F	Т
Т	Т	F	Т	Т	Т	Т
Т	Т	Т	Т	Т	F	T

▶ The truth table shows that the WFF $(P \rightarrow (Q \rightarrow P)) \lor \neg R$ is always true, so it satisfiable under any interpretation. But we don't need the whole truth table to prove this; the WFF is true for any interpretation in which R is false (for example).

Epilogue: Logic, Programming and Computation

▶ In the KMP algorithm, for each character in the target string *T* we identify the longest substring of *T* ending with that character which matches a prefix of the target string.

- These lengths are stored in what is known as a prefix table (which in Unit 4 we represented as a list).
- Consider the target string T

Below is an incomplete prefix table for the target string given above. Complete the prefix table by writing the missing numbers in the appropriate boxes.

0		1	0		2		4		0
---	--	---	---	--	---	--	---	--	---

Q 6

Consider the following function, which takes a list as an argument. You may assume that the list contains a number of integer values and is not empty.

```
def average(aList):
    n = len(aList)
    total = 0
for item in aList:
    total = total + item
    mean = total / n
return mean
```

▶ From the five options below, select the **one** that represents the correct combination of T(n) and Big-O complexity for this function. You may assume that a step (i.e. the basic unit of computation) is the assignment statement.

A.
$$T(n) = 3 + n^2 \text{ and } O(n^2)$$

B.
$$T(n) = n + 2 \text{ and } O(n^2)$$

C.
$$T(n) = 2n + 2$$
 and $O(n)$

D.
$$T(n) = 3n + n^2 \text{ and } O(n^2)$$

E.
$$T(n) = n + 3 \text{ and } O(n)$$

Example Algorithm Design

Searching

- Given an ordered list (xs) and a value (val), return
 - ▶ Position of val in xs or
 - ▶ Some indication if val is not present
- Simple strategy: check each value in the list in turn
- ▶ Better strategy: use the ordered property of the list to reduce the range of the list to be searched each turn
 - Set a range of the list
 - If val equals the mid point of the list, return the mid point
 - Otherwise half the range to search
 - If the range becomes negative, report not present (return some distinguished value)

- ▶ Which **two** of the following statements are **true**?
- A. A decision problem is any problem stated in a formal language.
- B. A computational problem is a problem that is expressed sufficiently precisely that it is possible to build an algorithm that will solve all instances of that problem.
- C. An algorithm consists of a precisely stated, step-by-step list of instructions.
- D. Computational thinking is the skill to formulate a problem as a computational problem, and then construct a good computational solution, in the form of an algorithm, to solve this problem, or explain why there is no such solution.

M269 Exam 2013.J

Q 1 Solution

- Options C and D are true.
- ▶ Option A is wrong because decision problems have to have a yes-no answer.
- Option B is wrong because there are computational problems that we can state and build algorithms for, but cannot always be solved.

M269 Epilogue

Logics

- ▶ First-Order Predicate Logic (or just First-Order Logic) has variables that range over sets of values and predicates (For All (∀), Exists (∃)) that express some properties over a range of elements of a set.
- Propositional logic can be regarded as a zero order logic since there are no variables — just atomic names and connectives.
- ► Higher order logics have variables that range over *more* things for example, predicates over predicates or variables over types (not elements of sets).

Phil Molyneux

M269 Exam Revision Agenda & Aims

Jnits 6 & 7

Units 3, 4 &

nits 1 & 2

ection 2

Exam Techniques

Epilogue: Logic, Programming and Computation

- Relationships between logics and programming:
- Using logic to reason about the behaviour of fragments of code in particular programming languages.
- Viewing a particular programming language as syntactic sugar for some logic system (quite likely augmented with various features such as built-in arithmetic and so on)
- For example, Haskell can be viewed as syntactic sugar for System F (also known as the Girard-Reynolds polymorphic lambda calculus or the second-order lambda calculus).
- Prolog as first order logic with a resolution theorem prover with Horn clauses
- Procedural programming (Java, C#, JavaScript, Python) and Hoare logic

Epilogue: Logic. Programming and Computation

M269 Epilogue

Programming and Computation

- A programming language is really some logic system
- ▶ Type systems in programming languages (such as polymorphic strong types in Haskell, ML, Miranda, generics and templates in Java, C# and so on) are key examples of the application of logics in programming
- In theory, you could do all your programming in:
- ▶ a Turing machine see Morphett's Turing machine simulator
- ► the Lambda calculus
 - Burch's Lambda Calculator
 - ► Sestoft's Lambda calculus reduction workbench

Practical Programming Languages

- Practical programming languages try to resolve various tensions:
- Application specific features spreadsheets, statistics, graphics. . .
- Extensions to help you (or force you) to think more clearly
- Powerful type systems
- ► Elegant ways of combining little programs into bigger ones (so you never have to write a big program)
