1 M269 End of Module Tutorial: Agenda

- Welcome & Introductions
- Topics from TMA03
- Abstract Data Types — Bags
- Abstract Data Types — Graphs
- Complexity
- Computability

Introductions — Me

- *Name* Phil Molyneux
- *Background* Physics and Maths, Operational Research, Computer Science
 - Undergraduate: Physics and Maths (Sussex)
 - Postgraduate: Physics (Sussex), Operational Research (Brunel), Computer Science (University College, London)
- *First programming languages* Fortran, BASIC, Pascal
- *Favourite Software*
 - Haskell — pure functional programming language
 - Text editors TextMate, Sublime Text — previously Emacs

- Word processing and presentation slides in [L^AT_EX](#)
- [Mac OS X](#)
- *Learning style* — I read the manual before using the software (really)

Introductions — You

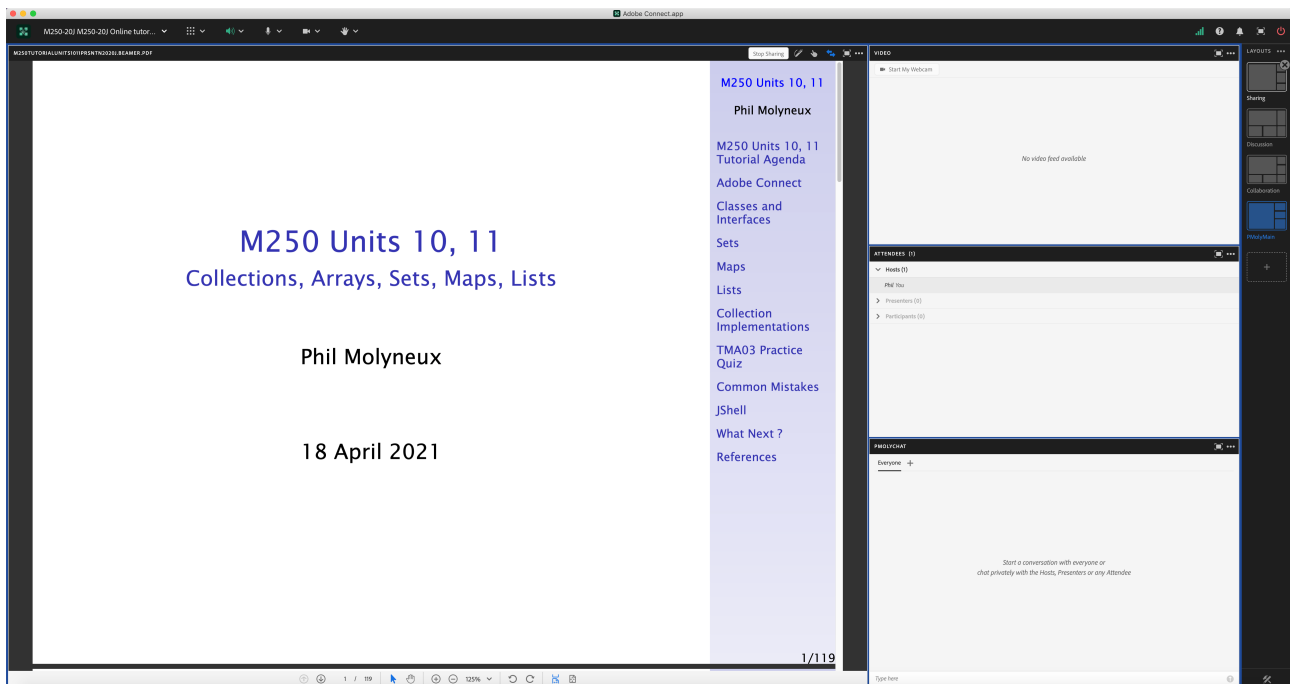

- *Name* ?
- *Position in M269* ? Which part of which Units and/or Reader have you read ?
- *Particular topics you want to look at* ?
- *Learning Syle* ?

2 Adobe Connect Interface and Settings

2.1 Adobe Connect Interface

Adobe Connect Interface — Host View

Adobe Connect Interface — Participant View

2.2 Adobe Connect Settings

Adobe Connect — Settings

- **Everybody** **Menu bar** **Meeting** **Speaker & Microphone Setup**
- **Menu bar** **Microphone** **Allow Participants to Use Microphone** ✓
- Check Participants see the entire slide including slide numbers bottom right **Workaround**
 - **Disable Draw** **Share pod** **Menu bar** **Draw icon**
 - **Fit Width** **Share pod** **Bottom bar** **Fit Width icon** ✓
- **Meeting** **Preferences** **General** **Host Cursor** **Show to all attendees**
- **Menu bar** **Video** **Enable Webcam for Participants** ✓
- Do not *Enable single speaker mode*
- Cancel hand tool
- Do not enable green pointer
- **Recording** **Meeting** **Record Session** ✓
- **Documents** Upload PDF with drag and drop to share pod
- Delete **Meeting** **Manage Meeting Information** **Uploaded Content** and **check filename** **click on delete**

Adobe Connect — Access

- **Tutor Access**

TutorHome **M269 Website** **Tutorials**

Cluster Tutorials **M269 Online tutorial room**

Tutor Groups **M269 Online tutor group room**

Module-wide Tutorials > M269 Online module-wide room

- **Attendance**

TutorHome > Students > View your tutorial timetables

- **Beamer Slide Scaling** 440% (422 x 563 mm)

- **Clear Everyone's Status**

Attendee Pod > Menu > Clear Everyone's Status

- **Grant Access** and send link via email

Meeting > Manage Access & Entry > Invite Participants...

- **Presenter Only Area**

Meeting > Enable/Disable Presenter Only Area

Adobe Connect — Keystroke Shortcuts

- [Keyboard shortcuts in Adobe Connect](#)
- **Toggle Mic**  + **M** (Mac), **Ctrl** + **M** (Win) (On/Disconnect)
- **Toggle Raise-Hand status**  + **E**
- **Close dialog box**  (Mac), **Esc** (Win)
- **End meeting**  + ****

2.3 Adobe Connect — Sharing Screen & Applications

- **Share My Screen** > Application tab > Terminal for [Terminal](#)
- **Share menu** > Change View > Zoom in for mismatch of screen size/resolution (Participants)
- (Presenter) Change to 75% and back to 100% (solves participants with smaller screen image overlap)
- Leave the application on the original display
- Beware blue hatched rectangles — from other (hidden) windows or contextual menus
- Presenter screen pointer affects viewer display — beware of moving the pointer away from the application
- First time: **System Preferences** > Security & Privacy > Privacy > Accessibility

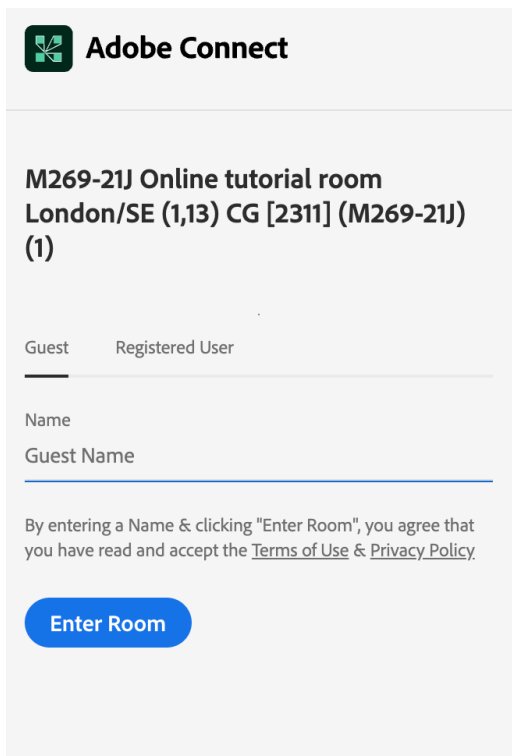

2.4 Adobe Connect — Ending a Meeting

- *Notes for the tutor only*
- **Student:** Meeting > Exit Adobe Connect
- **Tutor:**
- **Recording** Meeting > Stop Recording ✓
- **Remove Participants** Meeting > End Meeting... ✓

- Dialog box allows for message with default message:
 - *The host has ended this meeting. Thank you for attending.*
- **Recording availability** *In course Web site for joining the room, click on the eye icon in the list of recordings under your recording* — edit description and name
- **Meeting Information** Meeting > Manage Meeting Information — can access a range of information in Web page.
- **Delete File Upload** Meeting > Manage Meeting Information > Uploaded Content tab select file(s) and click Delete
- **Attendance Report** see course Web site for joining room

2.5 Adobe Connect — Invite Attendees

- **Provide Meeting URL** Menu > Meeting > Manage Access & Entry > Invite Participants...
- **Allow Access without Dialog** Menu > Meeting > Manage Meeting Information provides new browser window with *Meeting Information* Tab bar > Edit Information
- Check *Anyone who has the URL for the meeting can enter the room*
- Default *Only registered users and accepted guests may enter the room*
- **Reverts to default next session but URL is fixed**
- Guests have blue icon top, registered participants have yellow icon top — same icon if URL is open
- See [Start, attend, and manage Adobe Connect meetings and sessions](#)
- Click on the link sent in email from the Host
- Get the following on a Web page
- As *Guest* enter your name and click on Enter Room

Adobe Connect

**M269-21J Online tutorial room
London/SE (1,13) CG [2311] (M269-21J)
(1)**

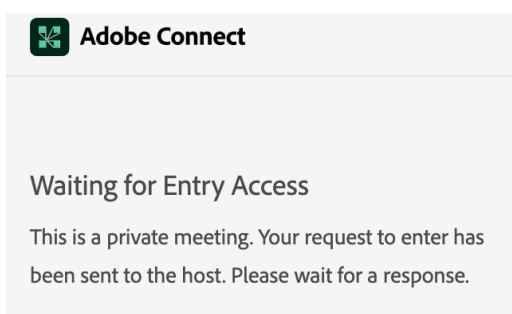

Guest Registered User

Name
Guest Name

By entering a Name & clicking "Enter Room", you agree that you have read and accept the [Terms of Use](#) & [Privacy Policy](#).

Enter Room

- See the *Waiting for Entry Access for Host* to give permission

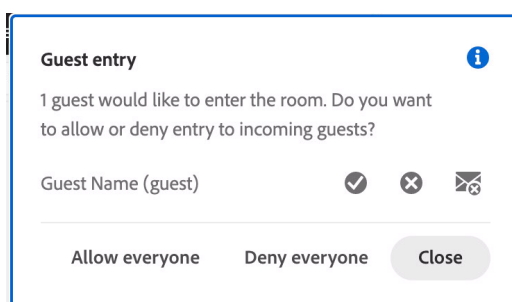

Adobe Connect

Waiting for Entry Access

This is a private meeting. Your request to enter has been sent to the host. Please wait for a response.

- *Host* sees the following dialog in *Adobe Connect* and grants access

Guest entry ⓘ

1 guest would like to enter the room. Do you want to allow or deny entry to incoming guests?

Guest Name (guest) ✓ ✕ ✉

Allow everyone Deny everyone Close

2.6 Layouts

- **Creating new layouts** example *Sharing* layout
- **Menu** > **Layouts** > **Create New Layout. ...** > **Create a New Layout dialog** > **Create a new blank layout** and name it *PMolyMain*
- New layout has no Pods but does have Layouts Bar open (see Layouts menu)
- **Pods**

- **Menu** > **Pods** > **Share** > **Add New Share** and resize/position — initial name is *Share n* — rename *PMolyShare*
- **Rename Pod** **Menu** > **Pods** > **Manage Pods...** > **Manage Pods** > **Select** > **Rename** or **Double-click & rename**
- Add Video pod and resize/reposition
- Add Attendance pod and resize/reposition
- Add Chat pod — rename it *PMolyChat* — and resize/reposition
- Dimensions of **Sharing** layout (on 27-inch iMac)
 - Width of Video, Attendees, Chat column 14 cm
 - Height of Video pod 9 cm
 - Height of Attendees pod 12 cm
 - Height of Chat pod 8 cm
- **Duplicating Layouts** does *not* give new instances of the Pods and is probably not a good idea (apart from local use to avoid delay in reloading Pods)
- **Auxiliary Layouts** name *PMolyAuxOn*
 - Create new Share pod
 - Use existing Chat pod
 - Use same Video and Attendance pods

2.7 Chat Pods

- **Format Chat text**
- **Chat Pod** > **menu icon** > **My Chat Color**
- Choices: Red, Orange, Green, Brown, Purple, Pink, Blue, Black
- Note: Color reverts to Black if you switch layouts
- **Chat Pod** > **menu icon** > **Show Timestamps**

2.8 Graphics Conversion for Web

- Conversion of the screen snaps for the installation of Anaconda on 1 May 2020
- Using GraphicConverter 11
- **File** > **Convert & Modify** > **Conversion** > **Convert**
- Select files to convert and destination folder
- Click on **Start selected Function** or **⌘ + ↵**

2.9 Adobe Connect Recordings

- **Menu bar** > **Meeting** > **Preferences** > **Video**
- **Aspect ratio** > **Standard (4:3)** (not Wide screen (16:9) default)

- **Video quality** > **Full HD** (1080p not High default 480p)
- **Recording** > **Menu bar** > **Meeting** > **Record Session** ✓
- **Export Recording**
- **Menu bar** > **Meeting** > **Manage Meeting Information**
- **New window** > **Recordings** > **check Tutorial** > **Access Type button**
- **check Public** > **check Allow viewers to download**
- **Download Recording**
- **New window** > **Recordings** > **check Tutorial** > **Actions** > **Download File**

3 M269 25J TMA03 Topics

- Part 1 Qs 1 – 2
- Part 2 Qs 3 –
- Q1 Recursion and trees
- Q2 Backtracking
- Q3 Complexity classes
- Q4 Turing machine
- Q5 Computability

4 Backtracking Notes

4.1 Introduction

- These notes are sketches on Backtracking for a sequence of notes on exhaustive searching
- The notes draw on:
- M269 25J Book Chp 22 *Backtracking*
- Bob Moore Backtracking tutorial slides and Python code
- [Bird and Wadler \(1988, page 161\)](#) *Introduction to Functional Programming*
- [Bird and Gibbons \(2020, sec 15.1\)](#) *Implicit search and the n-queens problem*

Both of the *Bird* references have some discussion of efficiency and improving performance — you should be aware the the former constructs partial solutions column (File) by column while the later constructs partial solution row (Rank) by row

[ToC](#)

4.2 Exhaustive Search and Backtracking

- **Exhaustive** look at every option which fits the basic criteria

- **Greedy** take locally optimum choice at every stage
 - Hardly ever works — requires a proof that this approach works for this particular case
 - Proofs not often included in a course — unfortunate
 - When greedy *does* work, it is more efficient than other methods
- **Backtracking** check if a partial solution can be extended towards a full solution
 - If not, go back and make a different choice
 - The *backtracking* may be done implicitly via recursion
- **Problem** choice of representation and initial setup — define *partial solutions*
- Define global constraints that must be satisfied by any solution (but perhaps not by partial solutions)
- Define local constraints that must be satisfied by partial solutions and determines if a partial solution can be extended
- Note that backtracking relies on local constraints — if there are no local constraints then you are on an exhaustive search
- **extend** — checks for solution
- **satisfiesGlobal** checks if solution satisfies global constraints
- **canExtend** checks if can extend partial solution

[ToC](#)

4.3 8-Queens Problem

- The problem of placing eight queens on an 8x8 chessboard so that no two queens threaten each other.
- Problem posed by Max Bezzel, chess composer, in 1848
- First solution by Franz Nauck in 1850
- Carl Friedrich Gauss also worked on the 8-queens problem and the generalised n -queens problem
- In 1874 S Günther proposed a solution method using determinants. J W L Glaisher refined the approach
- Edsger Dijkstra 1972 used **8 queens** to illustrate **structured programming** and **backtracking**
- Each column (or row) must contain exactly one queen. So a strategy for finding a solution is as follows.
- Place a queen in in the first column in any position.
- Then place a queen in the second column in any position not in check from the first queen.
- Continue until all eight queens have been placed.

- If at any point this is not possible (because all positions are in check) then *backtrack* and reapply the method to find a different position for the queens in the first m columns and try again

- **Board representation** list of ranks (rows)
- The board above is `[1, 5, 8, 6, 3, 7, 2, 4]`
- **Health warning** some implementations represent a board as list of files (columns) and may count from top to bottom
- These notes are based on:
 - [Bird \(1998, sec 6.5.1 page 161\)](#) *Introduction to Functional Programming*
 - [Bird and Gibbons \(2020, sec 15.1 page 369\)](#) uses ranks (rows) not files (columns)
 - Bob Moore's M269 Backtracking tutorial notes 2026
 - M269 notes chp 22
 - [Knuth \(2023, sec 7.2.2 page 30\)](#) *The Art of Computer Programming: The Combinatorial Algorithms Volume 4B*
- We first declare some type aliases for position and chessboard

```
6 type Rank = int # Rows
7 type File = int # Columns
```

```
8 type Board = [Rank] # Example
```

- The function `isSafe(brd, n)` tests whether the partial solution `brd` can be extended by one column with a queen in Rank `n`
- `isSafe(brd, n)` uses the function `inCheck(posn1, posn2)` to test if two queens at `posn1` and `posn2` hold each other in check

```
12 def inCheck(posn1: (File, Rank), posn2: (File, Rank)) -> bool :
13     """ Return True if Queen in position posn1 == (i, j)
14     can be threatened by Queen in posn2 == (m, n)
15     Precondition: not (i == m)
16     since we are placing queens File (column) by File
17     """
18     (i, j) = (posn1[0], posn1[1])
19     (m, n) = (posn2[0], posn2[1])
20     return ((j == n)
21            or (i + j == m + n)
22            or (i - j == m - n))
24 def isSafe(brd: Board, n: Rank) -> bool :
25     nxtFl = len(brd) + 1
26     lstOfCks = [not (inCheck((i, j), (nxtFl, n)))
27               for (i, j) in list(zip(range(1, len(brd)+1), brd))]
28     ]
29     return all(!lstOfCks)
```

- The function `queens` takes a board size `brdSize` and recursively finds all partial solutions of size `m`
- `queens8` and `queens4` specialise `queens` to boards of size 8 and 4

```
31 def queens(brdSize: Rank, m: File) -> [Board] :
32     if m == 0 :
33         return [[]]
34     else :
35         lstBrd = [brd + [n]
36                 for brd in queens(brdSize, m-1)
37                 for n in range(1, brdSize + 1)
38                 if isSafe(brd, n)]
39         return lstBrd
42 def queens8(m: File) -> [Board] :
43     return queens(8, m)
45 def queens4(m: File) -> [Board] :
46     return queens(4, m)
```

[ToC](#)

4.4 4-Queens Example

- Knuth (2023, sec 7.2.2 page 31) *Backtrack Programming* suggests that one of the best ways to learn about backtracking is to execute the algorithm by hand in the special case of `queens(4, 4)`
- This is done with the chessboard illustrated and colour coded
 - Blue for partial solutions
 - Red for not feasible
 - Green for solutions
- The initial blank board is not shown

- Following the boards is a different visualisation of the the *backtracking tree* with some further results for boards of different sizes
- Working column by column, fill the next column where the position is safe

```
Python3>>> queens4(0)
[[]] # by line 33
Python3>>> queens4(1)
[[1], [2], [3], [4]] # by line 35
Python3>>> queens4(2)
[[1, 3], [1, 4], [2, 4], [3, 1], [4, 1], [4, 2]] # by line 35
Python3>>> queens4(3)
[[1, 4, 2], [2, 4, 1], [3, 1, 4], [4, 1, 3]] # by line 35
Python3>>> queens4(4)
[[2, 4, 1, 3], [3, 1, 4, 2]] # by line 35
```

• Level 1

• Level 2 Block 1

• Level 3 Block 1

• Level 3 Block 2

• Level 4 Block 1

• Level 2 Block 2

• Level 3 Block 3

• Level 4 Block 2

• Level 2 Block 3

• Level 3 Block 4

• Level 4 Block 3

• Level 2 Block 4

• Level 3 Block 5

• Level 4 Block 4

• Level 3 Block 6

- The above chessboards *can* be used to form a tree of queen placement on the board
- This can also be represented as a *Backtrack tree* — see below

ToC

4.5 Backtrack Trees and Profiles

- The *profile* (p_0, p_1, \dots, p_n) of a backtrack tree is the number of nodes at each level

```
48 def backtrackProfile(brdSize: Rank) -> list[int] :
49     return [len(queens(brdSize,m)) for m in range(brdSize+1)]
```

```
Python3>>> backtrackProfile(4)
[1, 4, 6, 4, 2]
Python3>>> sum(backtrackProfile(4))
17
Python3>>> backtrackProfile(8)
[1, 8, 42, 140, 344, 568, 550, 312, 92]
Python3>>> sum(backtrackProfile(8))
2057
```

- **queens4** Solutions 2
 - Backtrack nodes 17
 - Number of possible sequences $4^4 = 256$
 - Arbitrary placings $\binom{16}{4} = 1820$
- **queens8** Solutions 92
 - Backtrack nodes 2057
 - Number of possible sequences $8^8 = 16,777,216$
 - Arbitrary placings $\binom{64}{8} = 4,426,165,368$

ToC

4.6 n -Queens Solutions

#-Qns	# Solns	#-Qns	# Solns
0	1	14	365,596
1	1	15	2,279,184
2	0	16	14,772,512
3	0	17	95,815,104
4	2	18	666,090,624
5	10	19	4,968,057,848
6	4	20	39,029,188,884

13	73,712	27	234,907,967,154,122,528

- **Source** [OEIS: A000170](#)
- [Knuth \(2023, page34\)](#) gives some anecdotes about the n -Queens calculations
- $Q(11)$ and $Q(12)$ were the last to be calculated by hand, the latter in 1910
- $Q(13)$ was calculated using a computer in 1960
- The calculation of $Q(14)$ was done in 1963 taking 120 hours on an IBM 1620
- $Q(15)$ took two hours in 1974 on an IBM 360-75
- $Q(27)$ was calculated in 2016 taking 383 days using a cluster of FPGA devices — it will probably be some time before this is exceeded
- Here are the timings and memory usage for my home computer — an Apple M1 Max from 2022 with 32 GB memory
- The code is a Haskell translation of Python listed earlier

```
GHCi> :set +s
GHCi> backtrackProfileSum(11)
(166926, [1,11,90,536,2468,8492,21362,37248,44148,34774,15116,2680])
(23.28 secs, 27,516,106,792 bytes)
GHCi> backtrackProfileSum(12)
(856189, [1,12,110,756,4080,16852,52856,120104,195270,222720,160964,68264,14200])
(148.38 secs, 174,226,075,008 bytes)
```

```
36 backtrackProfile :: Rank -> [Int]
37 backtrackProfile brdSize
38 = [length (queens brdSize m) |
39   m <- [0..brdSize]]

41 backtrackProfileSum :: Rank -> (Int,[Int])
42 backtrackProfileSum brdSize
43 = (profileSum,profileLst)
44   where
45     profileLst = backtrackProfile brdSize
46     profileSum = sum profileLst
```

- Here are further timings and memory usage for my home computer
- This is for sizes 13 and 14

- Notice we are heading towards some serious waiting even with not very large inputs

```
GHCi> :set +s
GHCi> backtrackProfileSum(13)
(4674890, [1, 13, 132, 1030, 6404, 31100, 117694
          , 335010, 707698, 1086568, 1151778, 813448, 350302, 73712])
(998.87 secs, 1,152,159,900,192 bytes)
GHCi> backtrackProfileSum(14)
(27358553, [1, 14, 156, 1364, 9632, 54068, 241484, 835056
           , 2211868, 4391988, 6323032, 6471872, 4511922, 1940500, 365596])
(7317.33 secs, 8,046,531,055,416 bytes)
```

[ToC](#)

5 Bags

5.1 Bags: Definitions

- **Bag** unordered collection that may contain duplicate items
- Also known as [Multiset](#)
- **Multiplicity** of an element is the number of instances of an element
- A Bag or Multiset may be defined as a two-tuple (A, m) where A is the underlying set from which elements are drawn, and a function $m : A \rightarrow \mathbb{N}$
- Note that some definitions exclude 0 from the range of m so it would be denoted $m : A \rightarrow \mathbb{N}_{\geq 1}$

Bag: Example

- 120 has prime factorization $120 = 2^3 \times 3^1 \times 5^1$
- Gives bag {2, 2, 2, 3, 5}
- The {} is an abuse of the usual set notation
- Representations:
- Sorted list [2, 2, 2, 3, 5]
- Unsorted list [2, 3, 2, 5, 2]
- Sorted list of pairs [(2, 3), (3, 1), (5, 1)]

house

Bag: Operations

- **Create** an empty bag
- **Queries**
 - `isEmptyBag`
 - `sizeBag` total number of elements
 - `elemOccurs` number of an element
 - `elemMember` is there at least one copy of an element
- **Construction**
 - `insertElem` insert one copy of an element
 - `insertMany` insert a number of copies
 - `deleteElem` delete a single copy of an element
 - `deleteMany` delete a number of copies
 - `deleteAll` deleteAll all copies

M269 2018J TMA02 Bag Operations

- `Bag()` creates a new empty bag
- `add(self, elem)` adds one copy of `elem` to the bag `self`
- `count(self, elem)` number of `elem` in the bag `self`
- `size(self)` total number of copies in `self`
- `clear(self, elem)` removes all copies of `elem`
- `ordered(self)` returns contents of bag `self` as a list of pairs (`count`, `elem`) in decreasing order of `count`

5.2 Bags: Implementations

- [Python Counter](#) is a subclass of `dict` which is Python's version of bags or multisets
- `Data.MultiSet` is Haskell's implementation of multisets or bags — it is based on `Data.Map`
- `Multiset` describes the ADT multiset or bag in several programming languages

5.3 Python Dictionaries

- A mapping object or dictionary maps hashable values to arbitrary objects
- A dictionary is a mutable object
- **Creation**

```
aD = dict()           # dictionary constructor
aD = {}              # literal empty dictionary
aD = {'to': 2, 'be': 2, 'or': 1, 'not': 1}
                    # literal key:value pairs
```

- **Creation methods**

```
Python3>>> aD = {'to': 2, 'be': 2
...           , 'or': 1, 'not': 1}
Python3>>> bD = dict(to=2, be=2, orA=1, notA=1)
Python3>>> cD = dict(zip(['to', 'be', 'or', 'not']
...                   , [2, 2, 1, 1]))
Python3>>> dD = dict([('to', 2), ('be', 2)
...                 , ('or', 1), ('not', 1)])
Python3>>> eD = dict({'to': 2, 'be': 2
...                 , 'or': 1, 'not': 1})
Python3>>> aD == cD == dD == eD
True
```

- Keywords in keyword arguments must not clash with built-in keywords
- [Implicit line joining](#) means we can split expressions in parentheses, square brackets or curly braces over more than one physical line without using backslashes.

Queries

- Queries in the *M269 Companion*

```
Python3>>> aD = {'to': 2, 'be': 2
...           , 'or': 1, 'not': 1}
Python3>>> len(aD)
4
Python3>>> key = 'be'
Python3>>> key in aD
True
Python3>>> aD[key]
2
Python3>>> aD.keys()
dict_keys(['to', 'or', 'not', 'be'])
Python3>>> list(aD.keys())
['to', 'or', 'not', 'be']
Python3>>> aD.items()
dict_items([('to', 2), ('or', 1)
...        , ('not', 1), ('be', 2)])
Python3>>> list(aD.items())
[('to', 2), ('or', 1), ('not', 1), ('be', 2)]
Python3>>> ('to', 2) in aD.items()
True
```

Total Exercise

Activity 1 Total Exercise

- Write a function, `totalValue`, that takes a dictionary, `xD`, and returns the total of all the values of the key:value pairs (Assumes value is a numeric type)

[Go to Answer](#)

Answer 1 Total Exercise

- Answer 1 Total Exercise

```
def totalValue(xD) :
    """
    totalValue takes a dictionary, xD,
    and returns the total of all the values
    of the key:value pairs
    Assumes value is a numeric type
    """

    tVal = sum([v for (k,v) in xD.items()])
    return tVal

# Alternative
# tVal = sum(xD.values())
```

- Answer 1 Total Exercise — sample use

```
Python3>>> aD
{'not': 1, 'be': 2, 'to': 2, 'or': 1}
Python3>>> totalValue(aD)
6
```

[Go to Activity](#)

Modifiers

- Modifiers in the *M269 Companion*

```
Python3>>> aD = {'to': 2, 'be': 2
...             , 'or': 1, 'not': 1}
Python3>>> aD
{'not': 1, 'be': 2, 'to': 2, 'or': 1}
Python3>>> aD['dobe'] = 2
Python3>>> aD
{'not': 1, 'be': 2, 'dobe': 2, 'to': 2, 'or': 1}
Python3>>> aD['do'] = 1
Python3>>> aD
{'do': 1, 'to': 2, 'or': 1
 , 'not': 1, 'be': 2, 'dobe': 2}
Python3>>> aD['be'] = 3
Python3>>> aD
{'do': 1, 'to': 2, 'or': 1
 , 'not': 1, 'be': 3, 'dobe': 2}
```

- Modifiers in the *M269 Companion*

```
Python3>>> aD
{'do': 1, 'to': 2, 'or': 1
 , 'not': 1, 'be': 3, 'dobe': 2}
Python3>>> aD['do'] = aD['do'] + 1
Python3>>> aD
{'do': 2, 'to': 2, 'or': 1
 , 'not': 1, 'be': 3, 'dobe': 2}
Python3>>> del aD['dobe']
Python3>>> aD
{'do': 2, 'to': 2, 'or': 1
 , 'not': 1, 'be': 3}
```

- It is an error to access a non-existent key

```
Python3>>> aD
{'do': 2, 'to': 2, 'or': 1
, 'not': 1, 'be': 3}
Python3>>> aD['dobe']
Traceback (most recent call last):
  File '<stdin>', line 1, in <module>
KeyError: 'dobe'
Python3>>> del aD['dobe']
Traceback (most recent call last):
  File '<stdin>', line 1, in <module>
KeyError: 'dobe'
Python3>>> aD['dobe'] = aD['dobe'] + 1
Traceback (most recent call last):
  File '<stdin>', line 1, in <module>
KeyError: 'dobe'
```

- If a key occurs more than once, the last value for that key becomes the corresponding value in the new dictionary. Not an error but could catch you out

```
Python3>>> fD = {'one' : 2, 'one': 3}
Python3>>> fD
{'one': 3}
```

Add One Exercise

Activity 2 Add One Exercise

- Write a function, `addOneToKey`, that takes a key, `key`, a dictionary, `xD`, and adds 1 to the value of the key

[Go to Answer](#)

Answer 2 Add One Exercise

- Answer 2 Add One Exercise

```
def addOneToKey(key, xD) :
    """
    addOneToKey takes a key and a dictionary
    and adds one to the value of the key
    Invariant for xD:
        if key in xD :
            xD[key] > 0
    """

    if key in xD :
        xD[key] = xD[key] + 1
    else :
        xD[key] = 1

    return xD
```

Answer 2 Add One Exercise

- Answer 2 Add One Exercise
- Note that `addOneToKey` has a side effect on the input dictionary

```
Python3>>> aD
{'do': 2, 'to': 2, 'or': 1, 'not': 1, 'be': 3}
Python3>>> addOneToKey('do', aD)
{'do': 3, 'to': 2, 'or': 1, 'not': 1, 'be': 3}
Python3>>> aD
{'do': 3, 'to': 2, 'or': 1, 'not': 1, 'be': 3}
Python3>>> addOneToKey('abba', aD)
{'do': 3, 'abba': 1, 'to': 2, 'or': 1
, 'not': 1, 'be': 3}
Python3>>> aD
```

```
{'do': 3, 'abba': 1, 'to': 2, 'or': 1
, 'not': 1, 'be': 3}
```

[Go to Activity](#)

Delete One Exercise

Activity 3 Delete One Exercise

- Write a function, `de1OneFromKey`, that takes a key, `key`, a dictionary, `xD`, and subtracts 1 from the value of the key if the key is in `xD`

[Go to Answer](#)

Answer 3 Delete One Exercise

- Answer 3 Delete One Exercise

```
def de1OneFromKey(key, xD) :
    """
    de1OneFromKey takes a key and a dictionary
    and deletes one from the value of the key
    Invariant for xD:
        if key in xD :
            xD[key] > 0
    """

    if not key in xD :
        pass
    elif xD[key] == 1 :
        del xD[key]
    else :
        xD[key] = xD[key] - 1

    return xD
```

Answer 3 Delete One Exercise

- Answer 3 Delete One Exercise — examples

```
Python3>>> aD
{'do': 3, 'abba': 1, 'to': 2, 'or': 1
, 'not': 1, 'be': 3}
Python3>>> de1OneFromKey('do',aD)
{'do': 2, 'abba': 1, 'to': 2, 'or': 1
, 'not': 1, 'be': 3}
Python3>>> aD
{'do': 2, 'abba': 1, 'to': 2, 'or': 1
, 'not': 1, 'be': 3}
Python3>>> de1OneFromKey('abba',aD)
{'do': 2, 'to': 2, 'or': 1, 'not': 1, 'be': 3}
Python3>>> aD
{'do': 2, 'to': 2, 'or': 1, 'not': 1, 'be': 3}
Python3>>> de1OneFromKey('bbc',aD)
{'do': 2, 'to': 2, 'or': 1, 'not': 1, 'be': 3}
Python3>>> aD
{'do': 2, 'to': 2, 'or': 1, 'not': 1, 'be': 3}
```

[Go to Activity](#)

5.4 Python Counter

- `Counter` objects are part of the `collections` library for container datatypes
- A `Counter` is a subclass of the mapping type `dict` and has a dictionary interface with some differences and extensions

- Creation:

```
1 #!/usr/bin/env python3
3 from collections import Counter
```

```
AnPython3>>> ct1 = Counter()
AnPython3>>> ct1          # new empty Counter
Counter()
AnPython3>>> ct2 = Counter('lambda_calculus')
AnPython3>>> ct2          # new Counter from iterable
Counter({'l': 3, 'a': 3, 'c': 2, 'u': 2, 'm': 1, 'b': 1, 'd': 1, '_': 1, 's': 1})
```

```
AnPython3>>> ct3 = Counter(a=10, b=0, c=-2, d=4)
AnPython3>>> ct3          # Counter from keyword args
Counter({'a': 10, 'd': 4, 'b': 0, 'c': -2})
AnPython3>>> ct4 = {'a': 10, 'd': 4, 'b': 0, 'c': -2}
AnPython3>>> ct4          # not a Counter
{'a': 10, 'd': 4, 'b': 0, 'c': -2}
AnPython3>>> type(ct4)
<class 'dict'>
AnPython3>>> ct5 = Counter({'a': 10, 'd': 4, 'b': 0, 'c': -2})
AnPython3>>> ct5          # Counter from a mapping
Counter({'a': 10, 'd': 4, 'b': 0, 'c': -2})
```

```
AnPython3>>> ct5 = Counter({'a': 10, 'd': 4, 'b': 0, 'c': -2})
AnPython3>>> ct5
Counter({'a': 10, 'd': 4, 'b': 0, 'c': -2})
AnPython3>>> ct5['e']
0
AnPython3>>> ct6 = +ct5    # remove zero and negative elements
AnPython3>>> ct6
Counter({'a': 10, 'd': 4})
AnPython3>>> ct7 = -ct5
AnPython3>>> ct7
Counter({'c': 2})
```

- Accessing missing elements is not an error (unlike a dictionary)
- Unary addition and subtraction are shortcuts for adding an empty counter or subtracting from an empty counter.

```
AnPython3>>> ct5 = Counter({'a': 10, 'd': 4, 'b': 0, 'c': -2})
AnPython3>>> ct5
Counter({'a': 10, 'd': 4, 'b': 0, 'c': -2})
AnPython3>>> ct8 = ct5.items()
AnPython3>>> ct8
dict_items([('a', 10), ('d', 4), ('b', 0), ('c', -2)])
AnPython3>>> ct9 = ct5.keys()
AnPython3>>> ct9
dict_keys(['a', 'd', 'b', 'c'])
AnPython3>>> ct10 = ct5.values()
AnPython3>>> ct10
dict_values([10, 4, 0, -2])
```

- `items()` Return a new view of the dictionary's items ((key, value) pairs).
- `keys()` Return a new view of the dictionary's keys.
- `values()` Return a new view of the dictionary's values.
- See [Dictionary view objects](#)
- They provide a dynamic view on the dictionary's entries
- When the dictionary changes, the view changes as well

5.5 M269 2021J Bags

```

3 from collections import Counter
4
5 """
6 Implementation of Bag ADT for M269 Prsntn 2021J TMA03 Q1
7 """
8
9 class Bag :
10
11     def __init__(self) :
12         """Create a new empty bag."""
13         self.items = Counter()
14         self.count = 0
15
16     def size(self) -> int:
17         """Return the total number of copies of all items in the bag."""
18         return self.count

```

```

20     def add(self, item: object) -> None :
21         """Add one copy of item to the bag.
22            Multiple copies are allowed."""
23         self.items[item] = self.items[item] + 1
24         self.count = self.count + 1
25
26     def discard(self, item: object) -> None :
27         """ Remove at most one copy of item from the bag.
28            No effect if item is not in the bag.
29         """
30         if self.items[item] > 0 :
31             self.items[item] = self.items[item] - 1
32             self.count = self.count - 1

```

```

35     def contains(self, item: object) -> bool :
36         """ Return True if there is at least
37            one copy of item in the bag.
38         """
39         # Add your own code here to replace the following statement
40         pass

```

- Hint what can a `Counter` do that in a `dict` would generate an error ?

```

42     def multiplicity(self, item: object) -> int :
43         """Return the number of copies of item in the bag.
44            Return zero if the item doesn't occur in the bag.
45         """
46         # Add your own code here to replace the following statement
47         pass

```

- Hint remember that `Counter` is a subclass of `dict`

```

49     def ordered(self) :
50         """Return the items ordered by decreasing multiplicity.
51            Return a list of (count, item) pairs.
52         """
53         # You will be asked to add your own code here later
54         pass

```

- Hint Modify the list comprehension below to only include items with `count > 0`
- What functions are available to sort a list ?

```

AnPython3>>> ct8 = ct5.items()
AnPython3>>> ct8
dict_items([('a', 10), ('d', 4), ('b', 0), ('c', -2)])
AnPython3>>> ct11 = [(ct,itm) for (itm,ct) in ct8]
AnPython3>>> ct11
[(10, 'a'), (4, 'd'), (0, 'b'), (-2, 'c')]

```

- See [Sorting HOW TO](#)
- What is the difference between `sorted()` and `list.sort()` ?

6 Abstract Data Types

6.1 Abstract Data Types — Overview

- **Abstract data type** is a type with associated operations, but whose representation is hidden (or not accessible)
- Common examples in most programming languages are Integer and Characters and other built in types such as tuples and lists
- **Abstract data types** are modeled on **Algebraic structures**
 - A set of values
 - Collection of operations on the values
 - Axioms for the operations may be specified as equations or pre and post conditions
- **Health Warning** different languages provide different ways of doing data abstraction with similar names that may mean subtly different things
- **Abstract Data Types and Object-Oriented Programming**
- Example: **Shape** with **Circles**, **Squares**, ... and operations **draw**, **moveTo**, ...
- **ADT** approach centres on the data type — that tells you what shapes exist
- For each operation on shapes, you describe what they do for different shapes.
- **OO** you declare that to be a shape, you have to have some operations (**draw**, **moveTo**)
- For each kind of shape you provide an implementation of the operations
- **OO** easier to answer *What is a circle?* and add new shapes
- **ADT** easier to answer *How do you draw a shape?* and add new operations
- **Health Warning and Optional Material** Discussions about the merits of **Functional programming** and **Object-oriented programming** tend to look like the disputes between **Lilliput** and **Blefuscus**
- **Abstract data type** article contrasts ADT and OO as algebra compared to co-algebra
- **What does coalgebra mean in the context of programming?** is a fairly technical but accessible article.
- **What does the forall keyword in Haskell do?** — is an accessible article on *Existential Quantification*
- **Bart Jacobs Coalgebra**
- **nLab Coalgebra**
- Beware the distinction between *concepts* and *features* in programming languages — see **OO Disaster**
- **Not for this session** — this slide is here just in case

```

1 data Shape
2   = Circle Point Radius
3   | Square Point Size
4
5 draw :: Shape -> Pict

```

```

6 draw (Circle p r) = drawCircle p r
7 draw (Square p s) = drawRectangle p s s

9 moveTo :: Point -> Shape -> Shape
10 moveTo p2 (Circle p1 r) = Circle p2 r
11 moveTo p2 (Square p1 s) = Square p2 s

13 shapes :: [Shape]
14 shapes = [Circle (0,0) 1, Square (1,1) 2]

16 shapes01 :: [Shape]
17 shapes01 = map (moveTo (2,2)) shapes

```

- Example based on Lennart Augustsson email of 23 June 2005 on Haskell list

```

1 class IsShape shape where
2   draw :: shape -> Pict
3   moveTo :: Point -> shape -> shape

5 data Shape = forall a . (IsShape a) => Shape a

7 data Circle = Circle Point Radius
8 instance IsShape Circle where
9   draw (Circle p r) = drawCircle p r
10  moveTo p2 (Circle p1 r) = Circle p2 r

12 data Square = Square Point Size
13 instance IsShape Square where
14   draw (Square p s) = drawRectangle p s s
15   moveTo p2 (Square p1 s) = Square p2 s

17 shapes :: [Shape]
18 shapes = [Shape (Circle (0,0) 10), Shape (Square (1,1) 2)]

20 shapes01 :: [Shape]
21 shapes01 = map (moveShapeTo (2,2)) shapes
22           where
23             moveShapeTo p (Shape s) = Shape (moveTo p s)

```

- Haskell Type Classes are similar to Java/OOP Interfaces
- See [OOP vs type classes](#)
- See [Java's Interface and Haskell's type class: differences and similarities?](#)
- See [Difference between OOP interfaces and FP type classes](#)
- See [What exactly makes the Haskell type system so revered \(vs say, Java\)?](#)
- **Health Warning** Much of OO programming is using the *OO syntax* to create ADTs

Commentary 2

1 Computability

- Description of Turing Machine
- Turing Machine examples
- Computability, Decidability and Algorithms
- Non-computability — Halting Problem
- Reductions and non-computability
- Lambda Calculus (optional)
- Note that the Computability notes are here mainly for reference since the Complexity notes refer to them
- This session is mainly on the Complexity topics

[ToC](#)

7 Computability

Ideas of Computation

- The idea of an algorithm and what is effectively computable
- **Church-Turing thesis** Every function that would naturally be regarded as computable can be computed by a deterministic Turing Machine. (Unit 7 Section 4)
- See [Phil Wadler on computability theory](#) performed as part of the Bright Club at The Strand in Edinburgh, Tuesday 28 April 2015

Computability — Models of Computation

- In automata theory, a *problem* is the question of deciding whether a given string is a member of some particular language
- If Σ is an alphabet, and L is a language over Σ , that is $L \subseteq \Sigma^*$, where Σ^* is the set of all strings over the alphabet Σ then we have a more formal definition of *decision problem*
- Given a string $w \in \Sigma^*$, decide whether $w \in L$
- Example: Testing for a prime number — can be expressed as the language L_p consisting of all binary strings whose value as a binary number is a prime number (only divisible by 1 or itself)
- See [Hopcroft et al. \(2007, section 1.5.4\)](#)

Automata Theory — Alphabets, Strings, Languages

- An **Alphabet**, Σ , is a finite, non-empty set of symbols.
- Binary alphabet $\Sigma = \{0, 1\}$
- Lower case letters $\Sigma = \{a, b, \dots, z\}$
- A **String** is a finite sequence of symbols from some alphabet

- 01101 is a string from the Binary alphabet $\Sigma = \{0, 1\}$
- The **Empty string**, ϵ , contains no symbols
- **Powers**: Σ^k is the set of strings of length k with symbols from Σ
- The set of all strings over an alphabet Σ is denoted Σ^*
- $\Sigma^* = \Sigma^0 \cup \Sigma^1 \cup \Sigma^2 \cup \dots$
- **Question** Does $\Sigma^0 = \emptyset$? (\emptyset is the empty set)
- An **Language**, L , is a subset of Σ^*
- The set of binary numerals whose value is a prime
 $\{10, 11, 101, 111, 1011, \dots\}$
- The set of binary numerals whose value is a square
 $\{100, 1001, 10000, 11001, \dots\}$

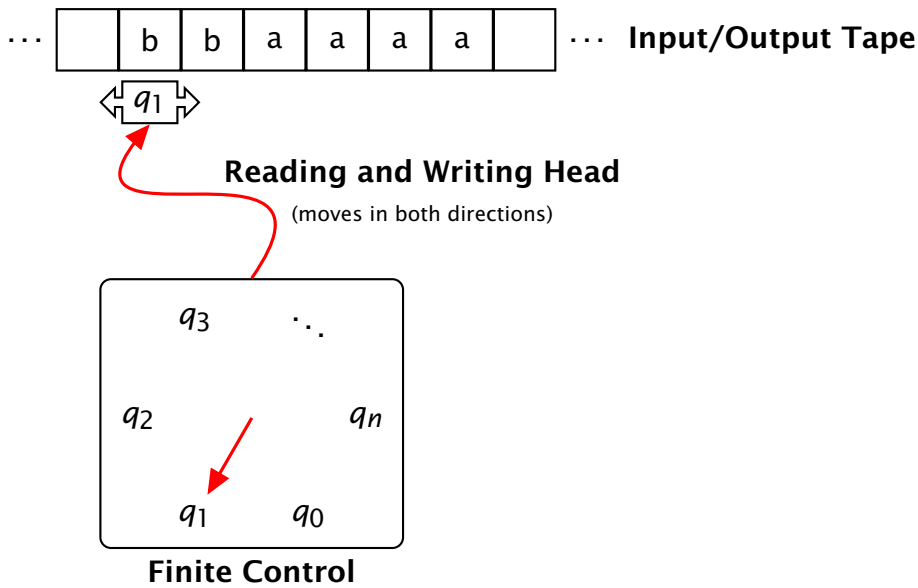

Computability — Church-Turing Thesis

- **Church-Turing thesis** Every function that would naturally be regarded as computable can be computed by a deterministic Turing Machine.
- **physical Church-Turing thesis** Any finite physical system can be simulated (to any degree of approximation) by a Universal Turing Machine.
- **strong Church-Turing thesis** Any finite physical system can be simulated (to any degree of approximation) with polynomial slowdown by a Universal Turing Machine.
- **Shor's algorithm** (1994) — quantum algorithm for factoring integers — an NP problem that is not known to be P — also not known to be NP-complete and we have no proof that it is not in P
- Reference: Section 4 of Unit 6 & 7 Reader

7.1 The Turing Machine

- **Finite control** which can be in any of a finite number of *states*
- **Tape** divided into cells, each of which can hold one of a finite number of symbols
- Initially, the **input**, which is a finite-length string of symbols in the *input alphabet*, is placed on the tape
- All other tape cells (extending unbounded left and right) hold a special symbol called *blank*
- A **tape head** which initially is over the leftmost input symbol
- A **move** of the Turing Machine depends on the state and the tape symbol scanned
- A move can change state, write a symbol in the current cell, move left, right or stay
- References: [Hopcroft et al. \(2007, page 326\)](#), Unit 6 & 7 Reader (section 5.3)

Turing Machine Diagram

Source: Sebastian Sardina <http://www.texample.net/tikz/examples/turing-machine-2/>

Date: 18 February 2012 (seen Sunday, 24 August 2014)

Further Source: Partly based on Ludger Humbert's pics of Universal Turing Machine at <https://haspe.homeip.net/projekte/ddi/browser/tex/pgf2/turingmaschine-schema.tex> (not found) — <http://www.texample.net/tikz/examples/turing-machine/>

Turing Machine notation

- Q finite set of states of the finite control
- Σ finite set of *input symbols* (M269 S)
- Γ complete set of *tape symbols* $\Sigma \subset \Gamma$
- δ Transition function (M269 instructions, I)
 $\delta :: Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, S\}$
 $\delta(q, X) \mapsto (p, Y, D)$
- $\delta(q, X)$ takes a state, q and a tape symbol, X and returns (p, Y, D) where p is a state, Y is a tape symbol to overwrite the current cell, D is a direction, Left, Right or Stay
- q_0 start state $q_0 \in Q$
- B blank symbol $B \in \Gamma$ and $B \notin \Sigma$
- F set of *final or accepting states* $F \subseteq Q$

ToC

7.2 Turing Machine Examples

Turing Machine Simulators

- [Morphett's Turing machine simulator](#) — the examples below are adapted from here
- [Ugarte's Turing machine simulator](#)
- [XKCD A Bunch of Rocks](#) — [XKCD Explanation](#)

Image below (will need expanding to be readable)

- The term *state* is used in two different ways:

The value of the *Finite Control*

The overall configuration of *Finite Control* and current contents of the tape

See [Turing Machine: State](#)

will lead to some confusion

XKCD A Bunch of Rocks

Turing Machine Examples: Meta-Exercise

- For each of the Turing Machine Examples below, identify $(Q, \Sigma, \Gamma, \delta, q_0, B, F)$

7.2.1 The Successor Function

- **Input** binary representation of numeral n
- **Output** binary representation of $n + 1$
- Example $1010 \mapsto 1011$ and $1011 \mapsto 1100$
- Initial cell: leftmost symbol of n
- **Strategy**
- **Stage A** make the rightmost cell the current cell
- **Stage B** Add 1 to the current cell.
- If the current cell is 0 then replace it with 1 and go to stage C
- If the current cell is 1 replace it with 0 and go to stage B and move Left
- If the current cell is blank, replace it by 1 and go to stage C
- **Stage C** Finish up by making the leftmost cell current
- Represent the Turing Machine program as a list of quintuples (q, X, p, Y, D)
- **Stage A**
 - $(q_0, 0, q_0, 0, R)$
 - $(q_0, 1, q_0, 1, R)$
 - (q_0, B, q_1, B, L)
- **Stage B**
 - $(q_1, 0, q_2, 1, S)$
 - $(q_1, 1, q_1, 0, L)$
 - $(q_1, B, q_2, 1, S)$
- **Stage C**
 - $(q_2, 0, q_2, 0, L)$
 - $(q_2, 1, q_2, 1, L)$
 - (q_2, B, q_h, B, R)

(Smith, 2013, page 315)

- **Exercise** Translate the quintuples (q, X, p, Y, D) into English and check they are the same as the specification
- **Stage A** make the rightmost cell the current cell
 - $(q_0, 0, q_0, 0, R)$
 - If state q_0 and read symbol 0 then stay in state q_0 write 0, move R

$(q_0, 1, q_0, 1, R)$

If state q_0 and read symbol 1 then stay in state q_0 write 1, move R

(q_0, B, q_1, B, L)

If state q_0 and read symbol B then state q_1 write B , move L

- **Exercise** Translate the quintuples (q, X, p, Y, D) into English

- **Stage B** Add 1 to the current cell.

$(q_1, 0, q_2, 1, S)$

If state q_1 and read symbol 0 then state q_2 write 1, stay

$(q_1, 1, q_1, 0, L)$

If state q_1 and read symbol 1 then state q_1 write 0, move L

$(q_1, B, q_2, 1, S)$

If state q_1 and read symbol B then state q_2 write 1, stay

- **Exercise** Translate the quintuples (q, X, p, Y, D) into English

- **Stage C** Finish up by making the leftmost cell current

$(q_2, 0, q_2, 0, L)$

If state q_2 and read symbol 0 then state q_2 write 0, move L

$(q_2, 1, q_2, 1, L)$

If state q_2 and read symbol 1 then state q_2 write 0, move L

(q_2, B, q_h, B, R)

If state q_2 and read symbol B then state q_h write B , move R HALT

- Notice that the Turing Machine feels like a series of **if ... then** or **case** statements inside a **while** loop

Turing Machine Examples: Meta-Exercise: Successor Function

- Identify $(Q, \Sigma, \Gamma, \delta, q_0, B, F)$ *Blank slide for working*
- Identify $(Q, \Sigma, \Gamma, \delta, q_0, B, F)$
- $Q = \{q_0, q_1, q_2, q_h\}$
- q_0 finding the rightmost symbol
- q_1 add 1 to current cell
- q_2 move to leftmost cell
- q_h finish
- $\Sigma = \{0, 1\}$
- $\Gamma = \Sigma \cup \{B\}$
- $\delta :: Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, S\}$
 $\delta(q, X) \mapsto (p, Y, D)$

δ is represented as $\{(q, X, p, Y, D)\}$

equivalent to $\{(q, X), (p, Y, D)\}$ set of pairs

- q_0 start with leftmost symbol under head, state moving to rightmost symbol

- B is \sqcup a visible space

- $F = \{q_h\}$

- **Sample Evaluation** $11 \mapsto 100$

- **Representation** $\dots BX_1 X_2 \dots X_{i-1} q X_i X_{i+1} \dots X_n B \dots$

$q_0 1 1$

$1 q_0 1$

$1 1 q_0 B$

$1 q_1 1$

$q_1 1 0$

$q_1 B 0 0$

$q_2 1 0 0$

$q_2 B 1 0 0$

$q_h 1 0 0$

- **Exercise** evaluate $1011 \mapsto 1100$

- **Representation** $\dots BX_1 X_2 \dots X_{i-1} q X_i X_{i+1} \dots X_n B \dots$

- q is the state of the TM

- The head is scanning the symbol X_i

- Leading or trailing blanks B are (usually) not shown unless the head is scanning them

- \vdash_M denotes one move of the TM M

- \vdash_M^* denotes zero or more moves

- \vdash will be used if the TM M is understood

- If (q, X_i, p, Y, L) denotes a TM move then

$X_1 \dots X_{i-1} q X_i \dots X_n \vdash_M X_1 \dots X_{i-2} p X_{i-1} Y \dots X_n$

(Hopcroft et al., 2007, sec 8.2.3)

ToC

7.2.2 The Binary Palindrome Function

- **Input** binary string s

- **Output** YES if palindrome, NO otherwise

- Example $1010 \mapsto NO$ and $1001 \mapsto YES$

- Initial cell: leftmost symbol of s

- **Strategy**
- **Stage A** read the leftmost symbol
- If blank then accept it and go to stage D otherwise erase it
- **Stage B** find the rightmost symbol
- If the current cell matches leftmost recently read then erase it and go to stage C
- Otherwise reject it and go to stage E
- **Stage C** return to the leftmost symbol and stage A
- **Stage D** print YES and halt
- **Stage E** erase the remaining string and print NO
- Represent the Turing Machine program as a list of quintuples (q, X, p, Y, D)
- **Stage A** read the leftmost symbol
 - $(q_0, 0, q_{1_o}, B, R)$
 - $(q_0, 1, q_{1_i}, B, R)$
 - (q_0, B, q_5, B, S)
- **Stage B** find rightmost symbol
 - $(q_{1_o}, B, q_{2_o}, B, L)$
 - $(q_{1_o}, *, q_{1_o}, *, R)$ * is a wild card, matches anything
 - $(q_{1_i}, B, q_{2_i}, B, L)$
 - $(q_{1_i}, *, q_{1_i}, *, R)$
- **Stage B** check
 - $(q_{2_o}, 0, q_3, B, L)$
 - (q_{2_o}, B, q_5, B, S)
 - $(q_{2_o}, *, q_6, *, S)$
 - $(q_{2_i}, 1, q_3, B, L)$
 - (q_{2_i}, B, q_5, B, S)
 - $(q_{2_i}, *, q_6, *, S)$
- **Stage C** return to the leftmost symbol and stage A
 - (q_3, B, q_5, B, S)
 - $(q_3, *, q_4, *, L)$
 - (q_4, B, q_0, B, R)
 - $(q_4, *, q_4, *, L)$
- **Stage D** accept and print YES
 - $(q_5, *, q_{5_a}, Y, R)$
 - $(q_{5_a}, *, q_{5_b}, E, R)$

$(q_{5_b}, *, q_7, S, S)$

- **Stage E** erase the remaining string and print NO

(q_6, B, q_{6_a}, N, R)

$(q_6, *, q_6, B, L)$

$(q_{6_a}, *, q_7, O, S)$

- Finish

(q_7, B, q_h, B, R)

$(q_7, *, q_7, *, L)$

Turing Machine Examples: Meta-Exercise: Binary Palindrome Function

- Identify $(Q, \Sigma, \Gamma, \delta, q_0, B, F)$ *Blank slide for working*
- Identify $(Q, \Sigma, \Gamma, \delta, q_0, B, F)$
- $Q = \{q_0, q_{1_o}, q_{1_i}, q_{2_o}, q_{2_i}, q_3, q_4, q_5, q_{5_a}, q_{5_b}, q_6, q_{6_a}, q_7, q_h\}$
- q_0 read leftmost symbol
- q_{1_o}, q_{1_i} find rightmost symbol looking for 0 or 1
- q_{2_o}, q_{2_i} check, confirm or reject
- q_3, q_4 check finish or move to start
- q_5, q_6, q_7 print YES or NO and finish

- q_h finish

- $\Sigma = \{0, 1\}$

- $\Gamma = \Sigma \cup \{B, Y, E, S, N, O\}$

- $\delta :: Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, S\}$

$\delta(q, X) \mapsto (p, Y, D)$

δ is represented as $\{(q, X, p, Y, D)\}$

equivalent to $\{(q, X), (p, Y, D)\}$ *set of pairs*

- Start with leftmost symbol under head, state q_0

- B is $_$ a visible space

- $F = \{q_h\}$

- **Sample Evaluation** 101 \mapsto YES

$q_0 101 \vdash Bq_{1_i} 01 \vdash B0q_{1_i} 1 \vdash B01q_{1_i} B$

$\vdash B0q_{2_i} 1$

$\vdash Bq_3 0B \vdash q_4 B0B$

$\vdash Bq_0 0B \vdash BBq_{1_o} B$

$\vdash Bq_{2_o} BB$

$\vdash Bq_5BB \vdash Yq_{5_a}B \vdash YEq_{5_b}B \vdash YEq_7S$
 $\vdash Yq_7ES \vdash Bq_7YES \vdash q_7BYES \vdash q_hYES$

- **Exercise** Evaluate $110 \mapsto \text{NO}$

7.2.3 Binary Addition Example

- **Input** two binary numerals separated by a single space $n1\ n2$
- **Output** binary numeral which is the sum of the inputs
- Example $110110 + 101011 \mapsto 1100001$
- Initial cell: leftmost symbol of $n1\ n2$
- **Insight** look at the arithmetic algorithm

```

┌ 1 1 0 1 1 0
┌ 1 0 1 0 1 1
├───────────
1 1 0 0 0 0 1

```

- **Discussion** how can we overwrite the first number with the result and remember how far we have gone ?

Binary Addition Example — Arithmetic Reinvented

```

┌ 1 1 0 1 1 0
┌ 1 0 1 0 1 1
├───────────
┌ 1 1 0 1 1 y
┌ 1 0 1 0 1 ┌
├───────────
┌ 1 1 1 0 x y
┌ 1 0 1 ┌ ┌
├───────────
1 0 0 x x x y
┌ 1 0 ┌ ┌ ┌
├───────────
1 0 x x x x y
┌ 1 ┌ ┌ ┌ ┌
├───────────
1 y x x x x y
┌ ┌ ┌ ┌ ┌ ┌
├───────────
1 1 0 0 0 0 1

```

- **Input** two binary numerals separated by a single space $n1\ n2$
- **Output** binary numeral which is the sum of the inputs
- Example $110110 + 101011 \mapsto 1100001$
- Initial cell: leftmost symbol of $n1\ n2$
- **Strategy**

- **Stage A** find the rightmost symbol
 - If the symbol is 0 erase and go to stage Bx
 - If the symbol is 1 erase go to stage By
 - If the symbol is blank go to stage F
 - dealing with each digit in n_2
 - if no further digits in n_2 go to final stage
- **Stage Bx** Move left to a blank go to stage Cx
- **Stage By** Move left to a blank go to stage Cy
 - moving to n_1
- **Stage Cx** Move left to find first 0, 1 or B
 - Turn 0 or B to X, turn 1 to Y and go to stage A
 - adding 0 to a digit finalises the result (no carry one)
- **Stage Cy** Move left to find first 0, 1 or B
 - Turn 0 or B to 1 and go to stage D
 - Turn 1 to 0, move left and go to stage Cy
 - dealing with the carry one in school arithmetic
- **Stage D** move right to X, Y or B and go to stage E
- **Stage E** replace 0 by X, 1 by Y, move right and go to Stage A
 - finalising the value of a digit resulting from a carry
- **Stage F** move left and replace X by 0, Y by 1 and at B halt
- Represent the Turing Machine program as a list of quintuples (q, X, p, Y, D)
- **Stage A** find the rightmost symbol
 - (q_0, B, q_1, B, R)
 - $(q_0, *, q_0, *, R)$ * is a wild card, matches anything
 - (q_1, B, q_2, B, L)
 - $(q_1, *, q_1, *, R)$
 - $(q_2, 0, q_{3_x}, B, L)$
 - $(q_2, 1, q_{3_y}, B, L)$
 - (q_2, B, q_7, B, L)
- **Stage Bx** move left to blank
 - $(q_{3_x}, B, q_{4_x}, B, L)$
 - $(q_{3_x}, *, q_{3_x}, *, L)$
- **Stage By** move left to blank
 - $(q_{3_y}, B, q_{4_y}, B, L)$

$(q_{3y}, *, q_{3y}, *, L)$

- **Stage Cx** move left to 0, 1, or blank

$(q_{4x}, 0, q_0, x, R)$

$(q_{4x}, 1, q_0, y, R)$

(q_{4x}, B, q_0, x, R)

$(q_{4x}, *, q_{4x}, *, L)$

- **Stage Cy** move left to 0, 1, or blank

$(q_{4y}, 0, q_5, 1, S)$

$(q_{4y}, 1, q_{4y}, 0, L)$

$(q_{4y}, B, q_5, 1, S)$

$(q_{4y}, *, q_{4y}, *, L)$

- **Stage D** move right to x, y or B

(q_5, x, q_6, x, L)

(q_5, y, q_6, y, L)

(q_5, B, q_6, B, L)

$(q_5, *, q_5, *, R)$

- **Stage E** replace 0 by x, 1 by y

$(q_6, 0, q_0, x, R)$

$(q_6, 1, q_0, y, R)$

- **Stage F** replace x by 0, y by 1

$(q_7, x, q_7, 0, L)$

$(q_7, y, q_7, 1, L)$

(q_7, B, q_h, B, R)

$(q_7, *, q_7, *, L)$

- **Exercise** Evaluate $11 + 10 \mapsto 101$

Turing Machine Examples: Meta-Exercise: Successor Function

- Identify $(Q, \Sigma, \Gamma, \delta, q_0, B, F)$ *Blank slide for working*
- Identify $(Q, \Sigma, \Gamma, \delta, q_0, B, F)$
- $Q = \{q_0, q_1, q_2, q_{3x}, q_{3y}, q_{4x}, q_{4y}, q_5, q_6, q_7, q_h\}$
- q_0, q_1, q_2 find rightmost symbol of second number
- q_{3x}, q_{3y} move left to inter-number blank
- q_{4x}, q_{4y} move left to 0, 1 or blank
- q_5 move right to x, y or B

- q_6 replace 0 by x , 1 by y and move right
- q_7 replace x by 0, y by 1 and move left
- q_h finish
- $\Sigma = \{0, 1\}$
- $\Gamma = \Sigma \cup \{B, x, y\}$
- $\delta :: Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, S\}$
 $\delta(q, X) \mapsto (p, Y, D)$
 δ is represented as $\{(q, X, p, Y, D)\}$
 equivalent to $\{((q, X), (p, Y, D))\}$ set of pairs
- Start with leftmost symbol under head, state q_0
- B is $_$ a visible space
- $F = \{q_h\}$
- **Exercise** Evaluate $11 + 10 \mapsto 101$
- **Stage A** find the rightmost symbol
 $BBq_011B10B$ Note space symbols B at start and end
 $\vdash BB1q_01B10B$
 $\vdash BB11q_0B10B$
 $\vdash BB11Bq_110B$

⊢ $B1XYq_0BBBB$

⊢ $B1XYBq_1BBB$

⊢ $B1XYq_2BBBB$

⊢ $B1Xq_7YBBBB$

- **Stage F** replace x by 0, y by 1

⊢ $B1q_7X1BBBB$

⊢ $Bq_7101BBBB$

⊢ $Bq_7B101BBBB$

⊢ $Bq_h101BBBB$

- This is mimicking what you learnt to do on paper as a child! Real *step-by-step* instructions
- See [Morphett's Turing machine simulator](#) for more examples (takes too long by hand!)

[ToC](#)

7.3 Computability, Decidability and Algorithms

Universal Turing Machine

- **Universal Turing Machine**, U, is a **Turing Machine** that can simulate any arbitrary Turing machine, M
- Achieves this by encoding the transition function of M in some standard way
- The input to U is the encoding for M followed by the data for M
- See [Turing machine examples](#)
- **Decidable** — there is a TM that will halt with yes/no for a decision problem — that is, given a string w over the alphabet of P the TM will halt and return yes/no the string is in the language P (same as *recursive* in [Recursion theory](#) — old use of the word)

- **Semi-decidable** — there is a TM will halt with yes if some string is in P but may loop forever on some inputs (same as *recursively enumerable*) — *Halting Problem*
- **Highly-undecidable** — no outcome for any input — *Totality, Equivalence Problems*

Undecidable Problems

- **Halting problem** — the problem of deciding, given a program and an input, whether the program will eventually halt with that input, or will run forever — term first used by Martin Davis 1952
- **Entscheidungsproblem** — the problem of deciding whether a given statement is provable from the axioms using the rules of logic — shown to be undecidable by Turing (1936) by reduction from the *Halting problem* to it
- **Type inference and type checking** in the second-order lambda calculus (important for functional programmers, Haskell, GHC implementation)
- **Undecidable problem** — see link to list

(Turing, 1936, 1937)

7.3.1 Non-Computability — Halting Problem

Halting Problem — Sketch Proof

- **Halting problem** — is there a program that can determine if any arbitrary program will halt or continue forever ?
- Assume we have such a program (Turing Machine) $h(f, x)$ that takes a program f and input x and determines if it halts or not

```
h(f, x)
= if f(x) runs forever
  return True
  else
  return False
```

- We shall prove this cannot exist by contradiction
- Now invent two further programs:
- $q(f)$ that takes a program f and runs h with the input to f being a copy of f
- $r(f)$ that runs $q(f)$ and halts if $q(f)$ returns **True**, otherwise it loops

```
q(f)
= h(f, f)

r(f)
= if q(f)
  return
  else
  while True: continue
```

- What happens if we run $r(r)$?
- If it loops, $q(r)$ returns **True** and it does not loop — contradiction.
- **Scoping theLoop Snooper: A proof that the Halting Problem is undecidable** Geoffrey K Pullum (21 May 2024)

Why undecidable problems must exist

- A *problem* is really membership of a string in some language
- The number of different languages over any alphabet of more than one symbol is uncountable
- Programs are finite strings over a finite alphabet (ASCII or Unicode) and hence countable.
- There must be an infinity (big) of problems more than programs.
- **Computational problem** — defined by a function
- **Computational problem is computable** if there is a Turing machine that will calculate the function.

Reference: [Hopcroft et al. \(2007, page 318\)](#)

Computability and Terminology (1)

- The idea of an *algorithm* dates back 3000 years to Euclid, Babylonians...
- In the 1930s the idea was made more formal: which *functions are computable*?
- A *function* is a set of pairs $f = \{(x, f(x)) : x \in X \wedge f(x) \in Y\}$ with the *function property*
- *Function property*: $(a, b) \in f \wedge (a, c) \in f \Rightarrow b = c$
- *Function property*: Same input implies same output
- Note that maths notation is deeply inconsistent here — see [Function](#) and [History of the function concept](#)
- *What do we mean by computing a function — an algorithm?*

Function: Relation and Rules

- The idea of function as a set of pairs ([Binary relation](#)) with the function property (each element of the domain has at most one element in the co-domain) is fairly recent — see [History of the function concept](#)
- School maths presents us with function as rule to get from the input to the output
- Example: the [square](#) function: [square](#) $x = x \times x$
- But lots of rules (or algorithms) can implement the same function
- [square1](#) $x = x^2$
- [square2](#) $x = \overbrace{x + \dots + x}^{x \text{ times}}$ if x is integer

Computability and Terminology (2)

- In the 1930s three definitions:
- [λ-Calculus](#), simple semantics for computation — [Alonzo Church](#)
- [General recursive functions](#) — [Kurt Gödel](#)
- [Universal \(Turing\) machine](#) — [Alan Turing](#)

- Terminology:
 - Recursive, recursively enumerable — Church, Kleene
 - Computable, computably enumerable — Gödel, Turing
 - Decidable, semi-decidable, highly undecidable
 - In the 1930s, *computers were human*
 - Unfortunate choice of terminology
- Turing and Church showed that the above three were equivalent
- Church-Turing thesis — function is intuitively computable if and only if Turing machine computable

Sources on Computability Terminology

- Soare (1996) on the history of the terms *computable* and *recursive* meaning *calculable*
- See also Soare (2013, sections 9.9–9.15) in Copeland et al. (2013)

[ToC](#)

7.3.2 Reductions & Non-Computability

Reducing one problem to another

- To reduce problem P_1 to P_2 , invent a construction that converts instances of P_1 to P_2 that have the same answer. That is:
 - any string in the language P_1 is converted to some string in the language P_2
 - any string over the alphabet of P_1 that is not in the language of P_1 is converted to a string that is not in the language P_2
- With this construction we can solve P_1
 - Given an instance of P_1 , that is, given a string w that may be in the language P_1 , apply the construction algorithm to produce a string x
 - Test whether x is in P_2 and give the same answer for w in P_1

(Hopcroft et al., 2007, page 322)

- **Problem Reduction — Ordinary Example**

- Want to phone Alice but don't have her number
- You know that Bill has her number
- So *reduce* the problem of finding Alice's number to the problem of getting hold of Bill

(Rich, 2007, page 449)

- The direction of reduction is important
- If we can reduce P_1 to P_2 then (in some sense) P_2 is at least as hard as P_1 (since a solution to P_2 will give us a solution to P_1)

- So, if P_2 is decidable then P_1 is decidable
- To show a problem is undecidable we have to reduce from a known undecidable problem to it
- $\forall x (dp_{P_1}(x) = dp_{P_2}(\text{reduce}(x)))$
- Since, if P_1 is undecidable then P_2 is undecidable
- Some further examples
- Totality and Equivalence Problems <http://www.cs.ucc.ie/~dgb/courses/toc/handout36.pdf>
- Totality and Equivalence Problems https://www.cs.rochester.edu/~nelson/courses/csc_173/computability/undecidable.html — (29 April 2022) was at [Undecidability](#)
- See [CS 3813 Formal Languages and Automata](#) (26 May 2022)

- A *reduction* of problem P_1 to problem P_2
 - transforms inputs to P_1 into inputs to P_2
 - runs algorithm A_2 (which solves P_2) and
 - interprets the outputs from A_2 as answers to P_1
- More formally: A problem P_1 is *reducible* to a problem P_2 if there is a function f that takes any input x to P_1 and transforms it to an input $f(x)$ of P_2 such that the solution of P_2 on $f(x)$ is the solution of P_1 on x

Source: [Bridge Theory of Computation, 2007](#)

- Given an algorithm (A_2) for matrix multiplication (P_2)
 - Input: pair of matrices, (M_1, M_2)
 - Output: matrix result of multiplying M_1 and M_2
- P_1 is the problem of squaring a matrix
 - Input: matrix M
 - Output: matrix M^2

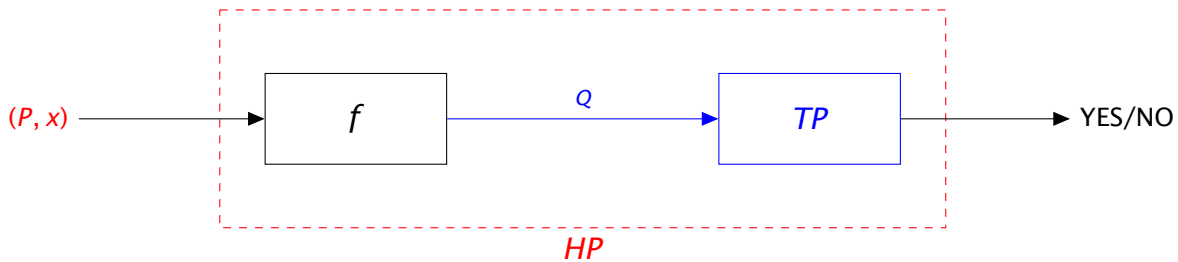

- Algorithm A1 has
 $f(M) = (M, M)$
 uses A2 to calculate $M \times M = M^2$

Non-Computable Problems

- If P_2 is computable (A2 exists) then P_1 is computable (f being simple or polynomial)
- Equivalently If P_1 is non-computable then P_2 is non-computable
- **Exercise:** show $B \rightarrow A \equiv \neg A \rightarrow \neg B$
- **Proof by Contrapositive**
- $B \rightarrow A \equiv \neg B \vee A$ by truth table or equivalences
 $\equiv \neg(\neg A) \vee \neg B$ commutativity and negation laws
 $\equiv \neg A \rightarrow \neg B$ equivalences
- Common error: switching the order round

Totality Problem

- **Totality Problem**
 - Input: program Q
 - Output: YES if Q terminates for all inputs else NO
- Assume we have algorithm TP to solve the Totality Problem
- Now reduce the Halting Problem to the Totality Problem

- Define f to transform inputs to HP to TP pseudo-Python

```
def f(P,x) :
  def Q(y):
    # ignore y
    P(x)
  return Q
```

- Run TP on Q
 - If TP returns YES then P halts on x
 - If TP returns NO then P does not halt on x
- We have *solved* the Halting Problem — contradiction

Negative Value Problem

- **Negative Value Problem**
 - Input: program Q which has no input and variable v used in Q
 - Output: YES if v ever gets assigned a negative value else NO
- Assume we have algorithm NVP to solve the Negative Value Problem
- Now reduce the Halting Problem to the Negative Value Problem

- Define f to transform inputs to HP to NVP pseudo-Python

```
def f(P,x) :
  def Q(y):
    # ignore y
    P(x)
    v = -1
  return (Q,var(v))
```

- Run NVP on $(Q, var(v))$ $var(v)$ gets the variable name
 - If NVP returns YES then P halts on x
 - If NVP returns NO then P does not halt on x
- We have *solved* the Halting Problem — contradiction

Squaring Function Problem

- **Squaring Function Problem**

- Input: program Q which takes an integer, y
- Output: YES if Q always returns the square of y else NO

- Assume we have algorithm SFP to solve the Squaring Function Problem
- Now reduce the Halting Problem to the Squaring Function Problem

- Define f to transform inputs to HP to SFP pseudo-Python

```
def f(P,x) :
    def Q(y):
        P(x)
        return y * y
    return Q
```

- Run SFP on Q
 - If SFP returns YES then P halts on x
 - If SFP returns NO then P does not halt on x
- We have *solved* the Halting Problem — contradiction

Equivalence Problem

- **Equivalence Problem**

- Input: two programs $P1$ and $P2$
- Output: YES if $P1$ and $P2$ solve the same problem (same output for same input) else NO

- Assume we have algorithm *EP* to solve the Equivalence Problem
- Now reduce the Totality Problem to the Equivalence Problem

- Define f to transform inputs to TP to EP [pseudo-Python](#)

```
def f(P) :
  def P1(x):
    P(x)
    return "Same_string"
  def P2(x)
    return "Same_string"
  return (P1,P2)
```

- Run EP on $(P1, P2)$
 - If EP returns YES then P halts on all inputs
 - If EP returns NO then P does not halt on all inputs
- We have *solved* the Totality Problem — contradiction

Rice's Theorem

- [Rice's Theorem](#) all non-trivial, semantic properties of programs are undecidable. [H G Rice 1951 PhD Thesis](#)
- Equivalently: For any non-trivial property of partial functions, no general and effective method can decide whether an algorithm computes a partial function with that property.
- A property of partial functions is called trivial if it holds for all partial computable functions or for none.
- [Rice's Theorem](#) and computability theory
- Let S be a set of languages that is nontrivial, meaning
 - there exists a Turing machine that recognizes a language in S
 - there exists a Turing machine that recognizes a language not in S
- Then, it is undecidable to determine whether the language recognized by an arbitrary Turing machine lies in S .

- This has implications for compilers and virus checkers
- Note that Rice's theorem does not say anything about those properties of machines or programs that are not also properties of functions and languages.
- For example, whether a machine runs for more than 100 steps on some input is a decidable property, even though it is non-trivial.

ToC

7.4 Lambda Calculus

7.4.1 Motivation

- [Lambda Calculus](#) is a [formal system](#) in [mathematical logic](#) for expressing [computation](#) based on function abstraction and application using variable [binding](#) and [substitution](#)
- Lambda calculus is [Turing complete](#) — it can simulate any Turing machine
- Introduced by Alonzo Church in 1930s
- Basis of functional programming languages — [Lisp](#), [Scheme](#), [ISWIM](#), [ML](#), [SASL](#), [KRC](#), [Miranda](#), [Haskell](#), [Scala](#), [F#](#)...
- **Note** this is not part of M269 but may help understand ideas of computability

Functions — Binding and Substitution

- School maths introduces functions as

$$f(x) = 3x^2 + 4x + 5$$
- Substitution: $f(2) = 3 \times 2^2 + 4 \times 2 + 5 = 25$
- Generalise: $f(x) = ax^2 + bx + c$
- What is wrong with the following:

$$f(a) = a \times a^2 + b \times a + c$$
- The ideas of free and bound variables and substitution

Expressions — Evaluation Strategies

- In evaluating an expression we have choices about the order in which we evaluate subterms
- Some choices may involve more work than others but the [Church-Rosser theorem](#) ensures that if the evaluation terminates then all choices get to the same answer
- The second edition of a famous book on [Functional programming](#) — [Bird \(1998, Ex 1.2.2, page 6\)](#) — had the following exercise:
 - How many ways can you evaluate $(3 + 7)^2$
 - List the evaluations and assumptions
- The first edition — [Bird and Wadler \(1988, Ex 1.2.2, page 6\)](#) — had the exercise:

- How many ways can you evaluate $((3 + 7)^2)^2$
- How many ways can you evaluate $(3 + 7)^2$

List the evaluations and assumptions

- **Answer** 3 ways
- **Reducible expressions** (redexes)
 - $x^2 \rightarrow x \times x$ where x is a term
 - $a + b$ where a and b are numbers
 - $x \times y$ where x and y are numbers

```
1 [sqr (3+7), ((3+7)*(3+7)), ((3+7)*10), (10*10), 100]
2 [sqr (3+7), ((3+7)*(3+7)), (10*(3+7)), (10*10), 100]
3 [sqr (3+7), sqr 10, (10*10), 100]
```

- The assumed redexes do not include **distributive laws**

$$(a + b) \times (x + y) \rightarrow a \times x + a \times y + b \times x + b \times y$$
- This would increase the number of different evaluations
- How many ways can you evaluate $((3 + 7)^2)^2$
- **Answer** 547 ways

```
1 [sqr sqr (3+7), (sqr (3+7)*sqr (3+7)), (sqr (3+7)*((3+7)*(3+7))), (sqr (3+7)*((3+7)*10)), (sqr
  ✓ (3+7)*(10*10)), (sqr (3+7)*100), (((3+7)*(3+7))*100), (((3+7)*10)*100),
  ✓ ((10*10)*100), (100*100), 10000]
2 [sqr sqr (3+7), (sqr (3+7)*sqr (3+7)), (sqr(3+7)*((3+7)*(3+7))), (sqr (3+7)*((3+7)*10)), (sqr
  ✓ (3+7)*(10*10)), (sqr (3+7)*100), (((3+7)*(3+7))*100), ((10*(3+7))*100),
  ✓ ((10*10)*100), (100*100), 10000]
```

```
546 [sqr sqr (3+7), sqr sqr 10, sqr (10*10), ((10*10)*(10*10)), (100*(10*10)), (100*100), 10000]
547 [sqr sqr (3+7), sqr sqr 10, sqr (10*10), sqr 100, (100*100), 10000]
```

- Enumerating all 547 ways may have taken some concentration
- The actual **Evaluation strategy** used by a particular programming language implementation may have optimisations which make an evaluation which looks costly to be somewhat cheaper
- For example, the **Haskell** implementation **GHC optimises** the evaluation of common subexpressions so that $(3+7)$ will be evaluated only once

```
1 [sqr sqr (3+7), (sqr (3+7)*sqr (3+7)), (sqr (3+7)*((3+7)*(3+7))), (sqr (3+7)*((3+7)*10)), (sqr
  ✓ (3+7)*(10*10)), (sqr (3+7)*100), (((3+7)*(3+7))*100), (((3+7)*10)*100),
  ✓ ((10*10)*100), (100*100), 10000]
2 [sqr sqr (3+7), (sqr (3+7)*sqr (3+7)), (sqr(3+7)*((3+7)*(3+7))), (sqr (3+7)*((3+7)*10)), (sqr
  ✓ (3+7)*(10*10)), (sqr (3+7)*100), (((3+7)*(3+7))*100), ((10*(3+7))*100),
  ✓ ((10*10)*100), (100*100), 10000]
```

- M269 Unit 6/7 Reader *Logic and the Limits of Computation* alludes to other formalisations with equal power to a Turing Machine (pages 81 and 87)
- The *Reader* mentions Alonzo Church and his 1930s formalism (page 87, but does not give any detail)
- The notes in this section are optional and for comparison with the Turing Machine material

- Turing machine: explicit memory, state and implicit loop and case/if statement
- Lambda Calculus: function definition and application, explicit rules for evaluation (and transformation) of expressions, explicit rules for substitution (for function application)
- [Lambda calculus reduction workbench](#)
- [Lambda Calculus Calculator](#)

[ToC](#)

7.4.2 Lambda Terms

- A **variable**, x , is a lambda term
- If M is a lambda term and x is a variable, then $(\lambda x.M)$ is a lambda term — a **lambda abstraction** or function definition
- If M and N are lambda terms, the $(M N)$ is lambda term — an **application**
- Nothing else is a lambda term

(Lambda Calculus notes based on lecture slides at [CMSC 330, Spring 2011](#))

- Outermost parentheses are omitted $(M N) \equiv M N$
- Application is left associative $((M N) P) \equiv M N P$
- The body of an abstraction extends as far right as possible, subject to scope limited by parentheses
- $\lambda x.M N \equiv \lambda x.(M N)$ and not $(\lambda x.M) N$
- $\lambda x.\lambda y.\lambda z.M \equiv \lambda x y z.M$

Lambda Calculus Semantics

- What do we mean by *evaluating an expression*?
- To evaluate $(\lambda x.M)N$
- Evaluate M with x replaced by N
- This rule is called β -reduction
- $(\lambda x.M)N \xrightarrow{\beta} M[x := N]$
- $M[x := N]$ is M with occurrences of x replaced by N
- This operation is called *substitution* — see rules below

β -Reduction Examples

- $(\lambda x.x)z \rightarrow z$
- $(\lambda x.y)z \rightarrow y$
- $(\lambda x.x y)z \rightarrow z y$
a function that applies its argument to y

- $(\lambda x.x y)(\lambda z.z) \rightarrow (\lambda z.z)y \rightarrow y$
- $(\lambda x.\lambda y.x y)z \rightarrow \lambda y.z y$

A *curried* function of two arguments — applies first argument to second

- *currying* replaces $f(x, y)$ with $(f x)y$ — nice notational convenience — gives *partial application* for free

[ToC](#)

7.4.3 Substitution

- To define *substitution* use recursion on the structure of terms
- $x[x := N] \equiv N$
- $y[x := N] \equiv y$
- $(P Q)[x := N] \equiv (P[x := N]) (Q[x := N])$
- $(\lambda x.M)[x := N] = \lambda x.M$

In $(\lambda x.M)$, the x is a formal parameter and thus a local variable, different to any other

- $(\lambda y.M)[x := N] = \text{what?}$
- Look back at the school maths example above — a subtle point
- Renaming *bound variables consistently is allowed*
- $\lambda x.x \equiv \lambda y.y \equiv \lambda z.z$
- $\lambda y.\lambda x.y \equiv \lambda z.\lambda x.z$
- This is called α -conversion
- $(\lambda x.\lambda y.x y) y \rightarrow (\lambda x.\lambda z.x z) y \rightarrow \lambda z.y z$

- **Bound and Free Variables**

- $BV(x) = \emptyset$
- $BV(\lambda x.M) = BV(M) \cup \{x\}$
- $BV(M N) = BV(M) \cup BV(N)$
- $FV(x) = \{x\}$
- $FV(\lambda x.M) = FV(M) - \{x\}$
- $FV(M N) = FV(M) \cup FV(N)$

- The above is a formalisation of school maths
- A Lambda term with no free variables is said to be *closed* — such terms are also called **combinators** — see [Combinator](#) and [Combinatory logic](#) (Hankin, 2004, page 10)

- **α -conversion**

- $\lambda x.M \xrightarrow{\alpha} \lambda y.M[x := y]$ if $y \notin FV(M)$
- β -reduction final rule

- $(\lambda y.M)[x := N] = \lambda y.M$ if $x \notin FV(M)$
- $(\lambda y.M)[x := N] = \lambda y.M[x := N]$
if $x \in FV(M)$ and $y \notin FV(N)$
- $(\lambda y.M)[x := N] = \lambda z.M[y := z][x := N]$
if $x \in FV(M)$ and $y \in FV(N)$
 z is chosen to be first variable $z \notin FV(NM)$
- This is why you cannot go $f(a)$ when given
- $f(x) = ax^2 + bx + c$
- School maths — but made formal

Lambda Calculus — Rules Summary — Conversion

- α -conversion renaming bound variables
- $\lambda x.M \xrightarrow{\alpha} \lambda y.M[x := y]$ if $y \notin FV(M)$
- β -conversion function application
- $(\lambda x.M)N \xrightarrow{\beta} M[x := N]$
- η -conversion extensionality
- $\lambda x.Fx \xrightarrow{\eta} F$ if $x \notin FV(F)$

Lambda Calculus — Rules Summary — Substitution

1. $x[x := N] \equiv N$
2. $y[x := N] \equiv y$
3. $(PQ)[x := N] \equiv (P[x := N])(Q[x := N])$
4. $(\lambda x.M)[x := N] = \lambda x.M$
5. $(\lambda y.M)[x := N] = \lambda y.M$ if $x \notin FV(M)$
6. $(\lambda y.M)[x := N] = \lambda y.M[x := N]$
if $x \in FV(M)$ and $y \notin FV(N)$
7. $(\lambda y.M)[x := N] = \lambda z.M[y := z][x := N]$
if $x \in FV(M)$ and $y \in FV(N)$
 z is chosen to be first variable $z \notin FV(NM)$

[ToC](#)

7.4.4 Lambda Calculus Encodings

- So what does this formalism get us ?
- The Lambda Calculus is Turing complete

- We can encode any computation (if we are clever enough)
- Booleans and propositional logic
- Pairs
- Natural numbers and arithmetic
- Looping and recursion

Booleans and Propositional Logic

- True = $\lambda x.\lambda y.x$
- False = $\lambda x.\lambda y.y$
- IF a THEN b ELSE $c \equiv a b c$
- IF True THEN b ELSE $c \rightarrow (\lambda x.\lambda y.x) b c$
- $\rightarrow (\lambda y.b) c \rightarrow b$
- IF False THEN b ELSE $c \rightarrow (\lambda x.\lambda y.y) b c$
- $\rightarrow (\lambda y.y) c \rightarrow c$
- Not = $\lambda x.((x \text{ False}) \text{ True})$
- Not x = IF x THEN False ELSE True
- Exercise: evaluate Not True
- And = $\lambda x.\lambda y.((x y) \text{ False})$
- And $x y$ = IF x THEN y ELSE False
- Exercise: evaluate And True False
- Or = $\lambda x.\lambda y.((x \text{ True }) y)$
- Or $x y$ = IF x THEN True ELSE y
- Exercise: evaluate Or False True
- Exercise: evaluate Not True
- $\rightarrow (\lambda x.((x \text{ False}) \text{ True})) \text{ True}$
- $\rightarrow (\text{True False}) \text{ True}$
- Could go straight to False from here, but we shall fill in the detail
- $\rightarrow ((\lambda x.\lambda y.x) (\lambda x.\lambda y.y)) (\lambda x.\lambda y.x)$
- $\rightarrow (\lambda y.(\lambda x.\lambda y.y)) (\lambda x.\lambda y.x)$
- $\rightarrow (\lambda x.\lambda y.y) \equiv \text{False}$
- Exercise: evaluate And True False
- $\rightarrow (\text{IF } x \text{ THEN } y \text{ ELSE False}) \text{ True False}$
- $\rightarrow (\text{IF True THEN False ELSE False}) \rightarrow \text{False}$
- Exercise: evaluate Or False True

- $\rightarrow(\text{IF } x \text{ THEN True ELSE } y) \text{ False True}$
- $\rightarrow(\text{IF False THEN True ELSE True}) \rightarrow \text{True}$

Natural Numbers — Church Numerals

- Encoding of natural numbers
- $0 = \lambda f. \lambda y. y$
- $1 = \lambda f. \lambda y. f y$
- $2 = \lambda f. \lambda y. f (f y)$
- $3 = \lambda f. \lambda y. f (f (f y))$
- Successor $\text{Succ} = \lambda z. \lambda f. \lambda y. f (z f y)$
- $\text{Succ } 0 = (\lambda z. \lambda f. \lambda y. f (z f y)) (\lambda f. \lambda y. y)$
- $\rightarrow \lambda f. \lambda y. f ((\lambda f. \lambda y. y) f y)$
- $\rightarrow \lambda f. \lambda y. f ((\lambda y. y) y)$
- $\rightarrow \lambda f. \lambda y. f y = 1$

Natural Numbers — Operations

- $\text{isZero} = \lambda z. z (\lambda y. \text{False}) \text{ True}$
- Exercise: evaluate $\text{isZero } 0$
- If M and N are numerals (as λ expressions)
- Add $M N = \lambda x. \lambda y. (M x) ((N x) y)$
- Mult $M N = \lambda x. (M (N x))$
- Exercise: show $1 + 1 = 2$

Pairs

- Encoding of a pair a, b
- $(a, b) = \lambda x. \text{IF } x \text{ THEN } a \text{ ELSE } b$
- $\text{FST} = \lambda f. f \text{ True}$
- $\text{SND} = \lambda f. f \text{ False}$
- Exercise: evaluate $\text{FST } (a, b)$
- Exercise: evaluate $\text{SND } (a, b)$

The Fixpoint Combinator

- $Y = \lambda f. (\lambda x. f (x x)) (\lambda x. f (x x))$
- $Y F = \lambda f. (\lambda x. f (x x)) (\lambda x. f (x x)) F$
- $\rightarrow (\lambda x. F (x x)) (\lambda x. F (x x))$
- $F((\lambda x. F (x x)) (\lambda x. F (x x))) = F(Y F)$

- $(Y F)$ is a **fixed point** of F
- We can use Y to achieve recursion for F
- **Recursion implementation — Factorial**
- $\text{Fact} = \lambda f. \lambda n. \text{IF } n = 0 \text{ THEN } 1 \text{ ELSE } n * (f (n - 1))$
- $(Y \text{ Fact})1 = (\text{Fact } (Y \text{ Fact}))1$
- $\rightarrow \text{IF } 1 = 0 \text{ THEN } 1 \text{ ELSE } 1 * ((Y \text{ Fact}) 0)$
- $\rightarrow 1 * ((Y \text{ Fact}) 0)$
- $\rightarrow 1 * (\text{Fact } (Y \text{ Fact}) 0)$
- $\rightarrow 1 * \text{IF } 0 = 0 \text{ THEN } 1 \text{ ELSE } 0 * ((Y \text{ Fact}) (0 - 1))$
- $\rightarrow 1 * 1 \rightarrow 1$
- $\text{Factorial } n = (Y \text{ Fact}) n$
- Recursion implemented with a non-recursive function Y

[ToC](#)

Turing Machines, Lambda Calculus and Programming Languages

- Anything computable can be represented as TM or Lambda Calculus
- But programs would be slow, large and hard to read
- In practice use the ideas to create more expressive languages which include built-in primitives
- Also leads to ideas on data types
- Polymorphic data types
- Algebraic data types
- Also leads on to ideas on higher order functions — functions that take functions as arguments or returns functions as results.

2 Complexity

- Complexity Classes **P** and **NP**
- Class **NP**
- NP-completeness
- NP-completeness and Boolean Satisfiability

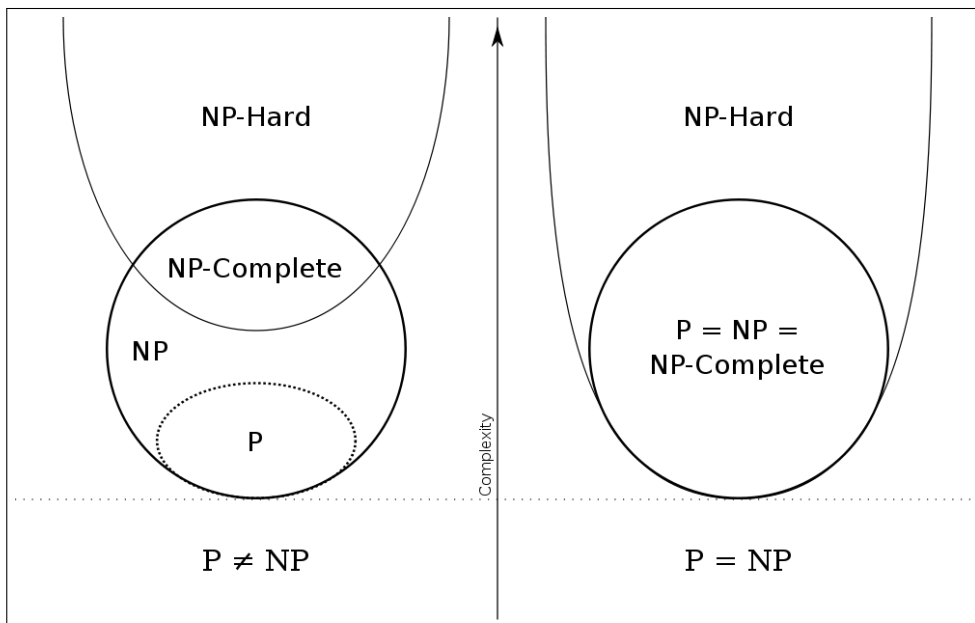

[ToC](#)

8 Complexity

8.1 Complexity Classes P and NP

- **P**, the set of all decision problems that can be solved in polynomial time on a deterministic Turing machine
- **NP**, the set of all decision problems whose solutions can be verified (certificate) in polynomial time
- Equivalently, NP, the set of all decision problems that can be solved in polynomial time on a non-deterministic Turing machine
- A decision problem, dp is **NP-complete** if
 1. dp is in NP and
 2. Every problem in NP is reducible to dp in polynomial time
- **NP-hard** — a problem satisfying the second condition, whether or not it satisfies the first condition. Class of problems which are at least as hard as the hardest problems in NP. NP-hard problems do not have to be in NP and may not be decision problems

Euler diagram for P, NP, NP-complete and NP-hard set of problems

Source: [Wikipedia NP-complete entry](#)

ToC

8.2 Class NP

- To formalise the definition of the **class NP**, we need to formalise the idea of checking a candidate solution
- Define a *certificate* for each problem input that would return Yes
- Describe the *verifier* algorithm
- Demonstrate the *verifier* algorithm has polynomial complexity

- The terms *certificate* and *verifier* have technical definitions in terms of languages and Turing Machines but can be thought of as *candidate solution* and *checker algorithm*

Example NP Decision Problems

- **Composite Numbers** Given a number N decide if N is a composite (i.e. non-prime) number
Certificate factorization of N
- **Connectivity** Given a graph G and two vertices s, t in G , decide if s is connected to t in G .
Certificate path from s to t
- **Linear Programming** Given a list of m linear inequalities with rational coefficients over n variables u_1, \dots, u_n (a linear inequality has the form $a_1 u_1 + a_2 u_2 + \dots + a_n u_n \leq b$ for some coefficients a_1, \dots, a_n, b), decide if there is an assignment of rational numbers to the variables u_1, \dots, u_n which satisfies all the inequalities
Certificate is the assignment
- The above are in **P**
- *Composite Numbers*, *Connectivity* and *Linear programming* are in **P**
- *Composite Numbers* follows from **Integer factorization** and the **AKS primality test** from 2004
- *Connectivity* follows from the breadth-first search algorithm
- *Linear programming* shown to be in **P** by the **Ellipsoid method**
- **Integer Programming** some or all variables are restricted to be integers
- **Travelling Salesperson** Given a set of nodes and distances between all pairs of nodes and a number k , decide if there is a closed circuit that visits every node exactly once and has total length at most k
Certificate sequence of nodes in such a tour
- **Subset sum** Given a list of numbers and a number T , decide if there is a subset that adds up to T
Certificate list of members of such a subset
- **Independent set (graph theory)** A subgraph of G with of at least k vertices which have no edges between them
Certificate the list of k vertices
- **Clique problem** Given a graph and a number k , decide if there is a complete subgraph (clique) of size k
Certificate list of nodes. For explanation see **Prove Clique is NP**
- The above are **NP-complete** — see **List of NP-complete problems**
- The following two are not known to be **P** nor **NP-complete**

- **Graph Isomorphism** Given two $n \times n$ adjacency matrices M_1, M_2 , decide if M_1 and M_2 define the same graph (up to renaming of the vertices)

Certificate the permutation $\pi : [n] \rightarrow [n]$ such that M_2 is equal to M_1 after reordering the indices of M_1 according to π

- **Integer factorization** Given three numbers N, L, U decide if N has a prime factor p in the interval $[L, U]$

Certificate is the factorization of N

Source & Explanation: [XKCD 287](#)

ToC

8.4 NP-Completeness and Boolean Satisfiability

- The *Boolean satisfiability problem (SAT)* was the first decision problem shown to be *NP-Complete*
- This section gives a sketch of an explanation
- **Health Warning** different texts have different notations and there will be some inconsistency in these notes
- **Health warning** these notes use some formal notation *to make the ideas more precise* — computation requires precise notation and is about manipulating strings according to precise rules.

Alphabets, Strings and Languages

- Notation:
- Σ is a set of symbols — the alphabet
- Σ^k is the set of all string of length k , which each symbol from Σ
- Example: if $\Sigma = \{0, 1\}$
 - $\Sigma^1 = \{0, 1\}$
 - $\Sigma^2 = \{00, 01, 10, 11\}$
- $\Sigma^0 = \{\epsilon\}$ where ϵ is the empty string
- Σ^* is the set of all possible strings over Σ
- $\Sigma^* = \Sigma^0 \cup \Sigma^1 \cup \Sigma^2 \cup \dots$
- A *Language*, L , over Σ is a subset of Σ^*
- $L \subseteq \Sigma^*$

Language Accepted by a Turing Machine

- Language accepted by Turing Machine, M denoted by $L(M)$
- $L(M)$ is the set of strings $w \in \Sigma^*$ accepted by M
- For *Final States* $F = \{Y, N\}$, a string $w \in \Sigma^*$ is accepted by $M \Leftrightarrow$ (if and only if) M starting in q_0 with w on the tape halts in state Y
- Calculating a function (**function problem**) can be turned into a **decision problem** by asking whether $f(x) = y$

The NP-Complete Class

- If we do not know if $P \neq NP$, what can we say?
- A language L is *NP-Complete* if:
 - $L \in NP$ and
 - for all other $L' \in NP$ there is a *polynomial time transformation* (Karp reducible, reduction) from L' to L

- Problem P_1 *polynomially reduces* (Karp reduces, transforms) to P_2 , written $P_1 \propto P_2$ or $P_1 \leq_p P_2$, iff $\exists f : dp_{P_1} \rightarrow dp_{P_2}$ such that
 - $\forall I \in dp_{P_1} [I \in Y_{P_1} \Leftrightarrow f(I) \in Y_{P_2}]$
 - f can be computed in polynomial time
- More formally, $L_1 \subseteq \Sigma_1^*$ polynomially transforms to $L_2 \subseteq \Sigma_2^*$, written $L_1 \propto L_2$ or $L_1 \leq_p L_2$, iff $\exists f : \Sigma_1^* \rightarrow \Sigma_2^*$ such that
 - $\forall x \in \Sigma_1^* [x \in L_1 \Leftrightarrow f(x) \in L_2]$
 - There is a polynomial time TM that computes f
- *Transitivity* If $L_1 \propto L_2$ and $L_2 \propto L_3$ then $L_1 \propto L_3$
- If L is NP-Hard and $L \in P$ then $P = NP$
- If L is NP-Complete, then $L \in P$ if and only if $P = NP$
- If L_0 is NP-Complete and $L \in NP$ and $L_0 \propto L$ then L is NP-Complete
- Hence if we find one NP-Complete problem, it may become easier to find more
- In 1971/1973 [Cook-Levin](#) showed that the [Boolean satisfiability problem \(SAT\)](#) is NP-Complete

The Boolean Satisfiability Problem

- A propositional logic formula or Boolean expression is built from variables, operators: AND (conjunction, \wedge), OR (disjunction, \vee), NOT (negation, \neg)
- A formula is said to be *satisfiable* if it can be made True by some assignment to its variables.
- *The Boolean Satisfiability Problem* is, given a formula, check if it is satisfiable.
 - *Instance*: a finite set U of Boolean variables and a finite set C of clauses over U
 - *Question*: Is there a satisfying truth assignment for C ?
- A *clause* is a disjunction of variables or negations of variables
- *Conjunctive normal form (CNF)* is a conjunction of clauses
- Any Boolean expression can be transformed to CNF
- Given a set of Boolean variable $U = \{u_1, u_2, \dots, u_n\}$
- A literal from U is either any u_i or the negation of some u_i (written $\overline{u_i}$) *usual notation $\neg u_i$*
- A clause is denoted as a subset of literals from U — $\{u_2, \overline{u_4}, u_5\}$ *usual notation $u_2 \vee \neg u_4 \vee u_5$*
- A clause is satisfied by an assignment to the variables if at least one of the literals evaluates to True (just like disjunction of the literals)
- Let C be a set of clauses over U — C is satisfiable iff there is some assignment of truth values to the variables so that every clause is satisfied (just like CNF)
- $C = \{\{u_1, u_2, u_3\}, \{\overline{u_2}, \overline{u_3}\}, \{u_2, \overline{u_3}\}\}$ is satisfiable

usual notation $(u_1 \vee u_2 \vee u_3) \wedge (\neg u_2 \vee \neg u_3) \wedge (u_2 \vee \neg u_3)$

assign $(u_1, u_2, u_3) = (T, F, F), (T, T, F), (F, T, F)$

- $C = \{\{u_1, u_2\}, \{u_1, \overline{u_2}\}, \{\overline{u_1}\}\}$ is not satisfiable
usual notation $(u_1 \vee u_2) \wedge (u_1 \vee \neg u_2) \wedge (\neg u_1)$
- Proof that SAT is NP-Complete looks at the structure of NDTMs and shows you can transform any NDTM to SAT in polynomial time (in fact logarithmic space suffices)
- SAT is in NP since you can check a solution in polynomial time
- To show that $\forall L \in \text{NP} : L \leq_p \text{SAT}$ invent a polynomial time algorithm for each polynomial time NDTM, M , which takes as input a string x and produces a Boolean formula E_x which is satisfiable iff M accepts x
- See [Cook-Levin theorem](#)

Sources

- [Garey and Johnson \(1979, page 34\)](#) has the notation $L_1 \leq_p L_2$ for polynomial transformation
- [Arora and Barak \(2009, page 42\)](#) has the notation $L_1 \leq_p L_2$ for *polynomial-time Karp reducible*
- The sketch of Cook's theorem is from [Garey and Johnson \(1979, page 38\)](#)
- For the satisfiable C we could have assignments $(u_1, u_2, u_3) \in \{(T, T, F), (T, F, F), (F, T, F)\}$

Coping with NP-Completeness

- What does it mean if a problem is NP-Complete ?
 - There is a P time verification algorithm.
 - There is a P time algorithm to solve it iff $P = \text{NP}$ (?)
 - No one has yet found a P time algorithm to solve any NP-Complete problem
 - So what do we do ?
- Improved exhaustive search — Dynamic Programming; Branch and Bound
- Heuristic methods — *acceptable* solutions in *acceptable* time — compromise on optimality
- Average time analysis — look for an algorithm with good average time — compromise on generality (see [Big-O Algorithm Complexity Cheatsheet](#))
- Probabilistic or Randomized algorithms — compromise on correctness

9 Future Work

Programming, Debugging, Psychology

Although programming techniques have improved immensely since the early days, the process of finding and correcting errors in programming — known graphically if inelegantly as *debugging* — still remains a most difficult, confused and unsatisfactory operation. The chief impact of this state of affairs is psychological. Although we are happy to pay lip-service to the adage that to err is human, most of us like to make a small private reservation about our own performance on special occasions when we really try. It is somewhat deflating to be shown publicly and incontrovertibly by a machine that even when we do try, we in fact make just as many mistakes as other people. If your pride cannot recover from this blow, you will never make a programmer.

Christopher Strachey, Scientific American 1966 vol 215 (3) September pp112-124

- To err is human, to really foul things up requires a computer.
